Complexity Theory

Exercise 10: Circuit Complexity

16 January 2018

Exercise 10.1. Denote with add: $\{0,1\}^{2n} \to \{0,1\}^{n+1}$ the function that takes two binary n-bit numbers x and y and returns their n+1-bit sum. Show that add can be computed with size $\mathcal{O}(n)$ circuits.

Exercise 10.2. Define the function maj_n: $\{0,1\}^n \to \{0,1\}^n$ by

$$\mathrm{maj}_n(x_1,\ldots,x_n) \coloneqq \begin{cases} 0 & \text{if } \sum x_i < n/2 \\ 1 & \text{if } \sum x_i \geq n/2. \end{cases}$$

Devised a circuit to compute maj_3 and test it on the example input 101 and 010.

* **Exercise 10.3.** Show how to compute maj_n with circuits of size $O(n \log n)$.

Exercise 10.4. Show $NC^1 \subseteq L$.

Exercise 10.5. Show that every Boolean function with n variables can be computed with a circuit of size $\mathcal{O}(n \cdot 2^n)$.

Exercise 10.6. Show that every language $L \subseteq \{ 1^n \mid n \in \mathbb{N} \}$ is contained in P/poly. Conclude that P/poly contains undecidable languages without using the undecidability of **UHALT**.

Exercise 10.7. Find a decidable language in P/poly that is not contained in P.

Hint

Take a language over $\{\,0,1\,\}$ that is 2ExpTime-hard and consider its unary encoding.
