Foundations of Logic Programming Tutorial 4 (on December 8th)

Lukas Schweizer

WS 2015/16

Exercise 4.1:

Show with the help of the Prolog tree how the cut is used in the following program,

$$\begin{array}{rl} r(a).\\ r(b).\\ q(a) \leftarrow r(X), \ !, \ p(a).\\ q(f(X)) \leftarrow r(X).\\ p(X) \leftarrow r(X).\\ p(f(X)) \leftarrow q(X), \ !, \ r(X).\\ p(g(X)) \leftarrow r(X). \end{array}$$

and where the query ?- p(X). is taken. What would happen without the cut?

Exercise 4.2:

Take the following program P:

```
\begin{array}{l} \mathbf{p} \leftarrow \mathbf{.} \\ \mathbf{p} \leftarrow \mathbf{p} \mathbf{.} \\ \mathbf{q} \leftarrow \mathbf{r} \mathbf{.} \\ \mathbf{q} \leftarrow \neg \mathbf{r} \mathbf{,} \mathbf{p} \mathbf{.} \\ \mathbf{r} \leftarrow \neg \mathbf{p} \mathbf{.} \\ \mathbf{t} \leftarrow \mathbf{q} \mathbf{.} \\ \mathbf{t} \leftarrow \mathbf{r} \mathbf{,} \neg \mathbf{q} \mathbf{.} \end{array}
```

a) Construct the dependency graph D_P of P.

b) Is P stratified and/or hierarchical?

- c) Give a stratification of P.
- d) Using your stratification to show how to compute the standard model M_P of P.

Exercise 4.3:

The built-in predicate fail/0, fails when Prolog encounters it as a goal. Thus, it can be viewed as an instruction for backtracking. On the other hand, the cut predicate !, blocks backtracking.

Define the predicate neg/1 which allows you to express *negation as failure*.
