Agenda

1. Concept Lattices
   - What is a concept?
   - Formal Context
   - Derivation Operators
   - Formal Concept
   - Concept Lattice
   - Computing All Concepts
   - Drawing Concept Lattices
   - Clarifying and Reducing a Formal Context
   - Interlude: ConExp
   - Additive Line Diagrams
   - Nested Line Diagrams

What is a concept?

Formal Concept Analysis models concepts as units of thought that consist of two parts:

- The *concept extent* comprises all objects that belong to the concept.
- The *concept intent* contains all attributes that all of the objects have in common.

FCA is used, amongst others, data analysis, information retrieval, data mining and software engineering.

Formal Context

Def.: A *formal context* is a triple (G, M, I), where

- G is a set of objects,
- M is a set of attributes, and
- I is a relation between G and M.

We read $(g, m) \in I$ as "object g has attribute m".

Derivation Operators

For $A \subseteq G$ we define $A' := \{m \in M \mid \forall g \in A : (g, m) \in I\}$.

For $B \subseteq M$ we define $B' := \{g \in G \mid \forall m \in B : (g, m) \in I\}$.

Formal Concept

Def.: A *formal concept* is a pair (A, B) with

- $A \subseteq G$ and $B \subseteq M$
- $A' = B$
- $B' = A$

A is the *extent* and B the *intent* of the concept.

intent (columns NPS Guided Tours, Hiking, Horseback Riding, Fishing)

Formal Concept

Lemma: (A, B) is a formal concept iff $A \subseteq G$, $B \subseteq M$ and A and B are both maximal with respect to $A \times B \subseteq I$.
I.e., every concept corresponds to a maximal rectangle in the relation I.

Def.: The set of all concepts of (G, M, I) is depicted as $\mathfrak{B}(G, M, I)$.

Concept Lattice

(Recapitulation: Partial Order)

Def. (recap.): $(A_1, B_1) \leqslant (A_2, B_2) :\Leftrightarrow A_1 \subseteq A_2 (\Leftrightarrow B_1 \supseteq B_2)$

Def.: The set of all concepts $\mathfrak{B}(G, M, I)$ together with the partial order $\leqslant$ is the *concept lattice* of the context (G, M, I) and is depicted with $\underline{\mathfrak{B}}(G, M, I)$.

Def.: A binary relation $R \subseteq P \times P$ on a set P is a *partial order* if it is

- reflexive (i.e., xRx for all $x \in P$),
- antisymmetric (i.e., xRy and yRx implies $x = y$ for all $x, y \in P$), and
- transitive (i.e., xRy and yRz implies xRz for all $x, y, z \in P$).

Concept Lattice: as Line Diagram

The *concept lattice* for the national park context.

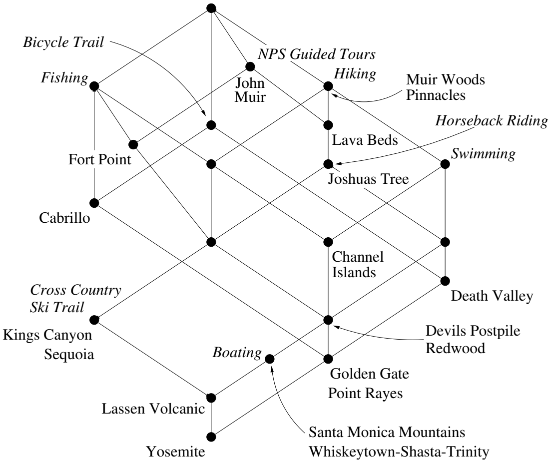
Concept Lattice: Implications (Preview)

Def.: An *implication* $X \to Y$ *holds* in a context, if every object that has all attributes from X also has all attributes from Y.



Examples:

- $\{$*Swimming*$\} \to \{$*Hiking*$\}$
- $\{$*Boating*$\} \to \{$*Swimming, Hiking, NPS Guided Tours, Fishing, Horseback Riding*$\}$
- $\{$*Bicycle Trail, NPS Guided Tours*$\} \to \{$*Swimming, Hiking, Horseback Riding*$\}$

Concept Lattice: Dual Context

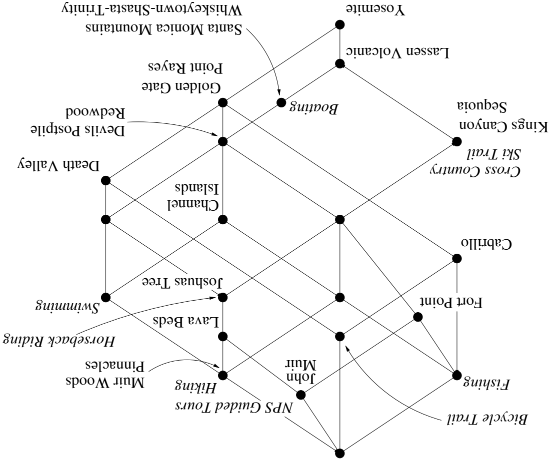
Def.: Let (G, M, I) be a context. Then (M, G, I^{-1}) with

$(m, g) \in I^{-1} \iff (g, m) \in I$

is the *dual context* of (G, M, I).

Theorem: Its concept lattice is isomorphic to $(\mathfrak{B}(G, M, I), \geqslant)$.

Remark: In general, G and M need not be disjunct, they can even be identical.



Concept Lattice

Recapitulation: Lattices

Def.: Let $(P, \leqslant)$ be a partial order and A a subset of P. A *lower bound* of A is an element ℓ of P with $\ell \leqslant a$ for all $a \in A$. An *upper bound* is defined dually. If there is a largest element in the set of all lower bounds of A, it is called the *infimum* of A and is denoted by inf A or $\bigwedge A$; dually, a least upper bound is called *supremum* and denoted by sup A or $\bigvee A$. If $A = \{x, y\}$, we also write $x \wedge y$ for inf A and $x \vee y$ for sup A. Infimum and supremum are frequently also called *meet* and *join*, respectively.

Def.: A partial order $(V, \leqslant)$ is a *lattice* if for any two elements x and y in V the infimum $x \wedge y$ and the supremum $x \vee y$ always exist. $(V, \leqslant)$ is called a *complete lattice* if the supremum $\bigvee X$ and the infimum $\bigwedge X$ exist for any subset X of V. Every complete lattice $(V, \leqslant)$ has a largest element $\bigvee V$, called the *unit element* of the lattice, denoted by 1_V. Dually, the smallest element 0_V is called the *zero element*.

Concept Lattice: The Basic Theorem on Concept Lattices

Def.: For an element v of a complete lattice $(V, \leqslant)$, we define $v_* := \bigvee\{x \in V \mid x < v\}$ and $v^* := \bigwedge\{x \in V \mid v < x\}$. We call v $\bigvee$*-irreducible*, if $v \neq v_*$, i.e., if v cannot be represented as the supremum of strictly smaller elements. In this case, v_* is the unique lower neighbour of v. Dually, we call v $\bigwedge$-irreducible, if $v \neq v^*$. $J(V, \leqslant)$ denotes the set of all $\bigvee$-irreducible elements and $M(V, \leqslant)$ the set of all $\bigwedge$-irreducible elements. A set $X \subseteq V$ is called *supremum-dense* in V, if every element from V can be represented as the supremum of a subset of X and, dually, *infimum-dense*, if $v = \bigwedge\{x \in X \mid v \leqslant x\}$ for all $v \in V$.

Def.: An *isomorphism* between two lattices $(V_1, \leqslant_1)$ and $(V_2, \leqslant_2)$ is a bijective mapping $\varphi : V_1 \to V_2$ such that for all $x, y \in V_1$ holds $x \leqslant_1 y$ if and only if $\varphi(x) \leqslant_2 \varphi(y)$. If such an isomorphism exists, we say that $(V_1, \leqslant_1)$ and $(V_2, \leqslant_2)$ are *isomorphic* and write $(V_1, \leqslant_1) \cong (V_2, \leqslant_2)$.

Concept Lattice: The Basic Theorem on Concept Lattices

Theorem

The concept lattice $\mathfrak{B}(G, M, I)$ *is a complete lattice in which infimum and supremum are given by*

$$\bigwedge_{t\in T}(A_t, B_t) = \left(\bigcap_{t\in T} A_t, \left(\bigcup_{t\in T} B_t\right)''\right) \text{ and } \bigvee_{t\in T}(A_t, B_t) = \left(\left(\bigcup_{t\in T} A_t\right)'', \bigcap_{t\in T} B_t\right)$$

A complete lattice $(V, \leqslant)$ *is isomorphic to* $\underline{\mathfrak{B}}(G, M, I)$ *if and only if there are mappings* $\tilde{\gamma} : G \to V$ *and* $\tilde{\mu} : M \to V$ *such that*

- $\tilde{\gamma}(G)$ *is supremum-dense in* $(V, \leqslant)$*,*
- $\tilde{\mu}(M)$ *is infimum-dense in* $(V, \leqslant)$*, and*
- gIm *is equivalent to* $\tilde{\gamma}(g) \leqslant \tilde{\mu}(m)$ *for all* $g \in G$ *and all* $m \in M$*.*

In particular, $(V, \leqslant) \cong \underline{\mathfrak{B}}(V, V, \leqslant)$.

Concept Lattice: The Duality Principle

- Let $(V, \leqslant)$ be a (complete) lattice. Then $(V, \geqslant)$ is also a (complete) lattice.
- (cf. with the definition of the dual context)
- If a theorem holds for (complete) lattices, then the 'dual theorem' also holds, i.e., the theorem where all occurrences of $\leqslant, \cap, \cup, \wedge, \vee, \mathbf{1}_V, \mathbf{0}_V$, etc. have been replaced by $\geqslant, \cup, \cap, \vee, \wedge, \mathbf{0}_V, \mathbf{1}_V$, etc.

Computing All Concepts

There are several algorithms to compute all concepts:

- naive approach
- intersection method
- Next-Closure (Ganter 1984) → Chapter 3
- Titanic (Stumme et al. 2001) → Chapter 3
- and several incremental algorithms

Computing All Concepts: Naive Approach

Theorem

Each concept of a context (G, M, I) *has the form* (X'', X') *for some subset* $X \subseteq G$ *and* (Y', Y'') *for some subset* $Y \subseteq M$*.*
Conversely, all such pairs are concepts.

Algorithm

Determine for every subset Y of M the pair (Y', Y'').

Computing All Concepts: Naive Approach

Theorem

Each concept of a context (G, M, I) has the form (X'', X') for some subset $X \subseteq G$ and (Y', Y'') for some subset $Y \subseteq M$.
Conversely, all such pairs are concepts.

Algorithm

Determine for every subset Y of M the pair (Y', Y'').

Inefficient! (Too) many concepts are generated multiple times.

Computing All Concepts: Intersection Method

- Suitable for manual computation (Wille 1982)
- Best worst-case time complexity (Nourine, Raynoud 1999)
- Based on the following

Theorem

Every extent is the intersection of attribute extents. (I.e., the closure system of all extents is generated by the attribute extents.)

Which intersections of attribute extents should we take?

Computing All Concepts: Intersection Method

How to determine all formal concepts of a formal context:

1. For each attribute $m \in M$ compute the attribute extent $\{m\}'$.
2. For any two sets in this list, compute their intersection. If it is not yet contained in the list, add it.
3. Repeat until no new extents are generated.
4. If G is not yet contained in the list, add it.
5. For every extent A in the list compute the corresponding intent A'.

Computing All Concepts: Intersection Method

On the blackboard: “triangle” example

Triangles				
abbreviation	coordinates			diagram
T1	(0,0)	(6,0)	(3,1)	T2	(0,0)	(1,0)	(1,1)	
T3	(0,0)	(4,0)	(1,2)

$T3$			×		
$T4$	×	×	×		
$T5$				×	
$T6$		×	×		
$T7$					×

Drawing Concept Lattices

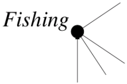
How to draw a concept lattice by hand:

1. Draw a small circle for the extent G at the top.
2. For every extent (starting with the one's with the most elements) draw a small circle and connect it with the lowest circle(s) whose extent contains the current extent.
3. Every attribute is written slightly above the circle of its attribute extent.
4. Every object is written slightly below the circle that is exactly below the circles that are labeled with the attributes of the object.

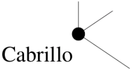
Drawing Concept Lattices

How you can check the drawn diagram:

1. Is it really a lattice? (that's often skipped)
2. Is every concept with exactly one upper neighbor labeled with at least one attribute?



3. Is every concept with exactly one lower neighbor labeled with at least one object?



4. Is for every $g \in G$ and $m \in M$ the label of the object g below the label of the attribute m iff $(g, m) \in I$ holds?

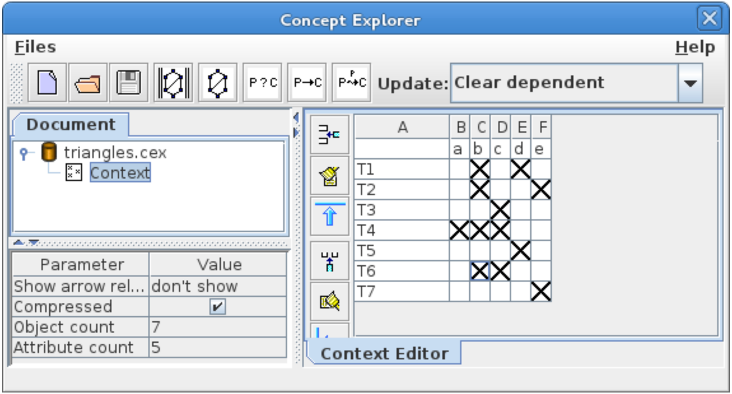
Clarifying and Reducing a Formal Context

Def.: A formal context (G, M, I) is called *clarified* if for every $g_1, g_2 \in G$ with $\{g_1\}' = \{g_2\}'$ holds $g_1 = g_2$ and for every $m_1, m_2 \in M$ with $\{m_1\}' = \{m_2\}'$ holds $m_1 = m_2$.
An object $g \in G$ is called *irreducible* if the *object concept* $(\{g\}'', \{g\}')$ is $\bigvee$-irreducible in $\underline{\mathfrak{B}}(G, M, I)$. Likewise, an attribute $m \in M$ is called *irreducible* if the *attribute concept* $(\{m\}', \{m\}'')$ is $\bigwedge$-irreducible in $\underline{\mathfrak{B}}(G, M, I)$.
A context is called *reduced*, if all its objects and attributes are irreducible.

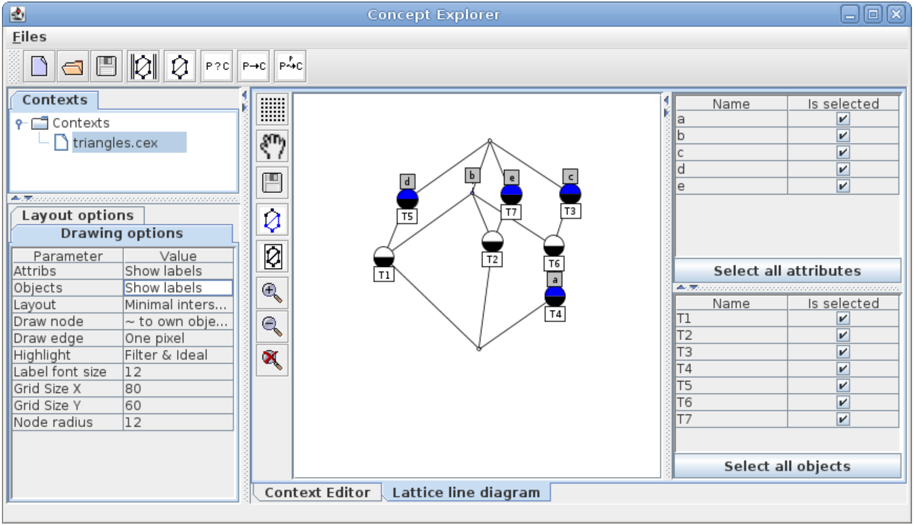
Theorem

A finite context and its reduced context have isomorphic concept lattices. For every finite lattice L there is (up to isomorphism) exactly one reduced context, the concept lattice of which is isomorphic to L, namely its standard context.

Interlude: ConExp



Interlude: ConExp



Additive Line Diagrams

Def.: An attribute $m \in M$ is called *irreducible*, if there is no set X of attributes with $m \notin X$ such that $\{m\}' = \bigcap_{x \in X} \{x\}'$.
The set of irreducible attributes is depicted as M_{irr}.

We define the map $\mathrm{irr} : \underline{\mathfrak{B}}(G, M, I) \to \mathfrak{P}(M_{irr})$ as

$$\mathrm{irr}(A, B) := \{m \in B \mid m \text{ irreducible}\}.$$

Let $\mathrm{vec} : M_{irr} \to \mathbb{R} \times \mathbb{R}_{<0}$. Then

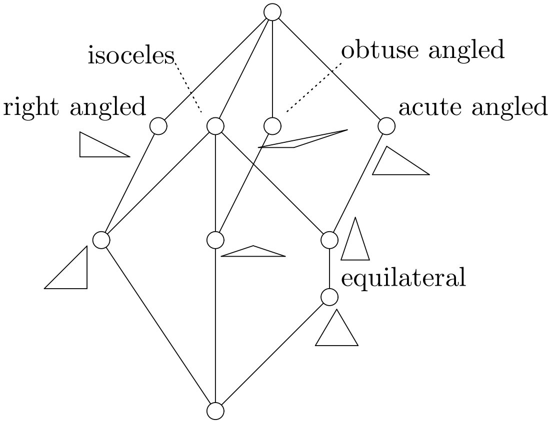
$$\mathrm{pos} : \underline{\mathfrak{B}}(G, M, I) \to \mathbb{R}^2 \text{ with } \mathrm{pos}(A, B) := \sum_{m \in \mathrm{irr}(A,B)} \mathrm{vec}(m)$$

is an *additive line diagram* of the concept lattice $\underline{\mathfrak{B}}(G, M, I)$.

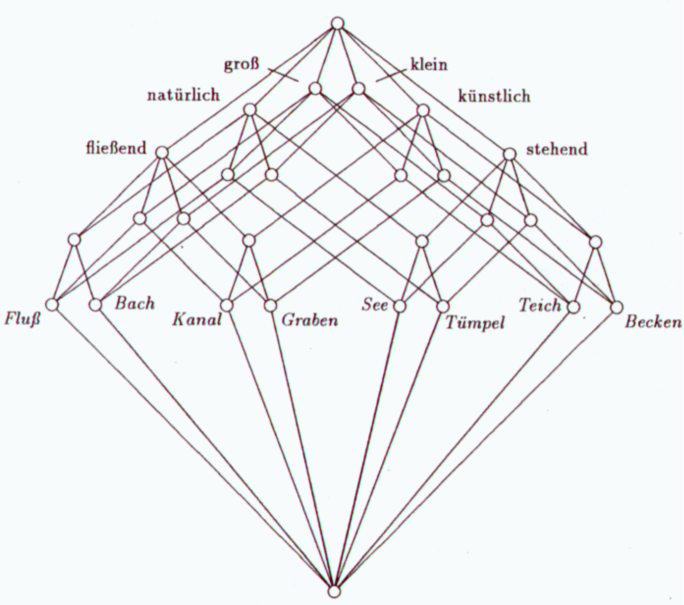
Additive Line Diagrams

An additive line diagram of the triangles context.

The position of the attribute concepts defines the position of all remaining concepts. If we consider the distance between $\mathbf{1}_{\underline{\mathfrak{B}}}$ and the attribute extents as vectors, then the position of any concept is equal to the sum of the vectors that belong to its concept intent.

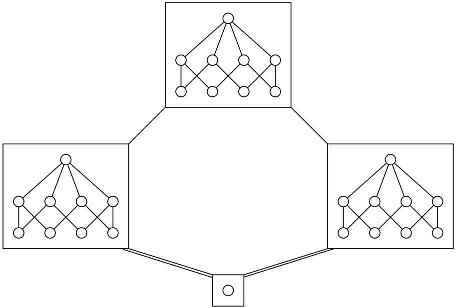


Additive Line Diagrams

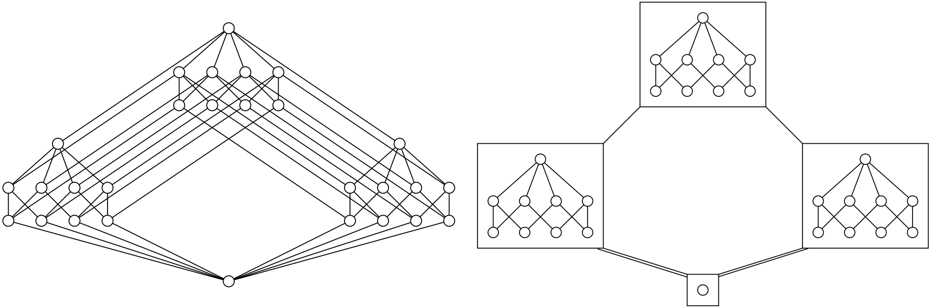


Nested Line Diagrams: Motivation and Idea

- readability of line diagrams often lost for many concepts ($\gtrapprox 50$)
- *nested line diagrams* allow us to go further
- and: support the visualization of changes caused by the addition of further attributes
- *basic idea:* cluster parts of an ordinary diagram and replace bundles of parallel lines between these parts by one line each



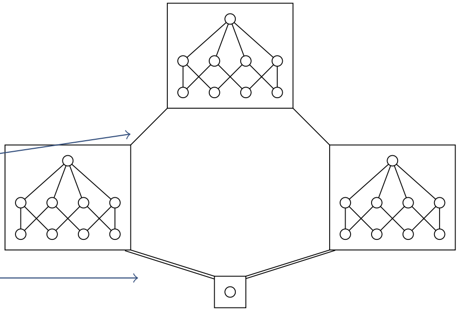
Nested Line Diagrams: Example



The previous concept lattice as ordinary line diagram and as nested line diagram. (For simplification, object and attribute labels have been omitted.)

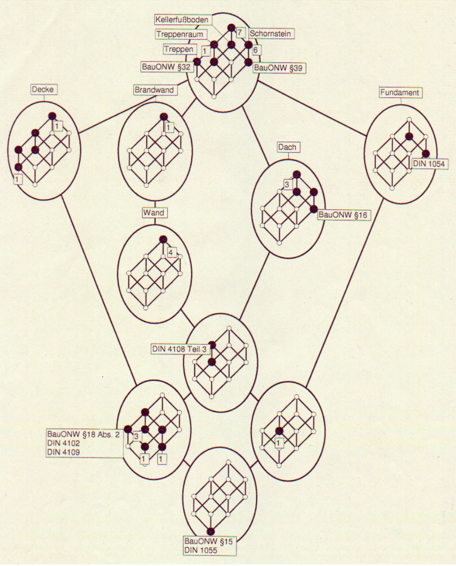
Nested Line Diagrams

- a nested line diagram consists of *boxes* which contain parts of the ordinary diagram and which are *connected by lines*
- simplest case: two boxes that are connected by a line are congruent → corresponding circles are direct neighbors
- double lines between two boxes: every element of the upper box is larger than every element of the lower box



Nested Line Diagrams

- two boxes connected by a single line need not be congruent but contain a part of two congruent figures
- the two congruent figures are drawn as "background structure" into the boxes
- elements are drawn as bold circles if they are part of the respective substructure
- the line connecting both boxes indicates that the respective pairs of elements of the background shall be connected with each other



Nested Line Diagrams: Drawing Example

Die Ducks. Psychogramm einer Sippe.

	generation			sex		financial status

Daisy		×			×		×	
Gustav		×		×			×	
Dagobert	×			×		×		
Annette	×				×		×	
Primus v. Quack	×			×			×	

Taken from: Grobian Gans: *Die Ducks. Psychogramm einer Sippe.* Rowohlt, Reinbek bei Hamburg 1972, ISBN 3-499-11481-X

Nested Line Diagrams: Construction

1. split the attribute set: $M = M_1 \cup M_2$
   (needs not be disjoint, more important: both sets bear meaning)
2. draw the line diagrams of the subcontexts

$$\mathbb{K}_i := (G, M_i, I \cap G \times M_i), i \in \{1, 2\}$$

   and label them with with objects and attributes, as usual

3. sketch a nested diagram of the product of the concept lattices $\underline{\mathfrak{B}}(\mathbb{K}_i)$
   1. draw a large diagram of $\underline{\mathfrak{B}}(\mathbb{K}_1)$ where the concepts are large boxes
   2. draw a copy of $\underline{\mathfrak{B}}(\mathbb{K}_2)$ into each box

Nested Line Diagrams: Labeling

- if a list of elements of $\underline{\mathfrak{B}}(G, M, I)$ exists, enter them according to their intents
- otherwise, enter the object concepts (whose intents can be read off directly from the context) and form all suprema

This gives us another method for determining a concept lattice by hand:

- split up the attribute set as appropriate
- determine the (small) concept lattices of the subcontexts
- draw their product as nested line diagram
- enter the object concepts and close against suprema

This is particularly advisable in order to arrive at a useful diagram quickly.

Nested Line Diagrams: Example

Baurecht in Nordrhein-Westfalen

Baurecht in Nordrhein-Westfalen

Nested Line Diagrams: Reading off Implications

- implications *within the inner scale* can be read off at the top concept:

$$\{\text{Treppen}\} \Rightarrow \{\text{Treppenraum}\}$$

- implications *within the outer scale* can be read off at it:

$$\{\text{Wand}\} \Rightarrow \{\text{Brandwand}\}$$
$$\{\text{Decke, Brandwand}\} \Rightarrow \{\text{Wand, Brandwand}\}$$
$$\{\text{Decke, Fundament}\} \Rightarrow \{?\}$$

- implications *between the inner and the outer scale* are shown by "not realized" concepts: premise = intent of the not-realized concept, conclusion = intent of the largest realized subconcept:

$$\{\text{Decke, Kellerfußboden}\} \Rightarrow \{\text{Treppenraum}\}$$
$$\{\text{Treppenraum, Schornstein}\} \Rightarrow \{\text{Decke, Wand, Brandwand, Dach}\}$$
$$\{\text{Fundament}\} \Rightarrow \{?\}$$
$$\{\text{Wand, Dach, Schornstein}\} \Rightarrow \{?\}$$
