Chapter 4

Declarative Interpretation

Outline

- Algebras (which provide a semantics of terms)
- Interpretations (which provide a semantics of programs)
- Soundness of SLD-resolution
- Completeness of SLD-resolution
- Least Herbrand models
- Computing least Herbrand models

What is an Interpretation?

```
direct(frankfurt,san_francisco).
direct(frankfurt,chicago).
direct(san_francisco,honolulu).
direct(honolulu,maui).
```

```
connection(X, Y) :- direct(X, Y).
connection(X, Y) :- direct(X, Z), connection(Z, Y).
```

```
D = {FRA, DRS, ORD, SFO, ...}
frankfurt<sub>J</sub> = FRA, chicago<sub>J</sub> = ORD, san-francisco<sub>J</sub> = SFO, ...
direct<sub>I</sub> = {(FRA, SFO), (FRA, ORD), ...}
connection<sub>I</sub> = {(FRA, SFO), (FRA, ORD), (FRA, HNL), ...}
```

What is an Interpretation?

```
add(X,0,X).
add(X,s(Y),s(Z)) := add(X,Y,Z).
```

```
D = \mathbb{N}

0_{J} = 0

s_{J} : \mathbb{N} \to \mathbb{N} \text{ such that } s_{J}(n) = n + 1

add_{J} = \{(0, 0, 0), (1, 0, 1), (0, 1, 1), (1, 1, 2), ...\}
```

Another Example

```
add(X,0,X).
add(X,s(Y),s(Z)) := add(X,Y,Z).
```

```
D = \{0, s(0), s(s(0)), ...\}

0_{J} = 0

s_{J} : D \to D \text{ such that } s_{J}(t) = s(t)

add_{I} = \{(0, 0, 0), (s(0), 0, s(0)), (0, s(0), s(0)), (s(0), s(0), s(s(0))), ...\}
```

(This will be called a "Herbrand model".)

Algebras

V set of variables, F ranked alphabet of function symbols: An algebra J for F (or pre-interpretation for F) consists of:

- 1. domain : \Leftrightarrow non-empty set D
- 2. assignment of a mapping

$$f_J: D^n \to D$$

to every $f \in F^{(n)}$ with $n \ge 0$

State σ over D : \Leftrightarrow mapping $\sigma : V \to D$ Extension of σ to $TU_{F,V}$: \Leftrightarrow $\sigma : TU_{F,V} \to D$ such that for every $f \in F^{(n)}$ $\sigma(f(t_1, ..., t_n)) = f_J(\sigma(t_1), ..., \sigma(t_n))$

Interpretations

F ranked alphabet of function symbols, \prod ranked alphabet of predicate symbols:

An interpretation *I* for *F* and \prod consists of:

- 1. algebra J for F (with domain D)
- 2. assignment of a relation

$$p_{I} \subseteq \underbrace{D \times ... \times D}_{n}$$

to every $p \in \prod^{(n)}$ with $n \ge 0$

Herbrand Universes and Bases

- Recall $TU_{F,V}$: \Leftrightarrow term universe over function symbols *F*, variables *V* $TB_{\prod,F,V}$: \Leftrightarrow term base (i.e., all atoms) over predicate symbols \prod and *F*, *V*
- Herbrand universe HU_F : \Leftrightarrow $TU_{F,\emptyset}$
- Herbrand base $HB_{\prod,F}$: \Leftrightarrow $TB_{\prod,F,\emptyset}$

Interpretations (Example)

Let
$$P_{add}$$
 "add-program".
 I_1, I_2, I_3, I_4, I_5 , and I_6 are interpretations for {s, 0} and {add}:
 $I_1: D_{I_1} = \mathbb{N}, 0_{I_1} = 0, s_{I_1}(n) = n + 1$ for each $n \in \mathbb{N}, add_{I_1} = \{(m, n, m + n) \mid m, n \in \mathbb{N}\}$
 $I_2: D_{I_2} = \mathbb{N}, 0_{I_2} = 0, s_{I_2}(n) = n + 1$ for each $n \in \mathbb{N}, add_{I_2} = \{(m, n, m * n) \mid m, n \in \mathbb{N}\}$
 $I_3: D_{I_3} = HU_{\{s, 0\}}, 0_{I_3} = 0, s_{I_3}(t) = s(t)$ for each $t \in HU_{\{s, 0\}}, add_{I_3} = \{(s^m(0), s^n(0), s^{m+n}(0)) \mid m, n \in \mathbb{N}\}$
 $I_4: D_{I_4} = HU_{\{s, 0\}}, 0_{I_4} = 0, s_{I_4}(t) = s(t)$ for each $t \in HU_{\{s, 0\}}, add_{I_4} = \emptyset$
 $I_5: D_{I_5} = HU_{\{s, 0\}}, 0_{I_5} = 0, s_{I_5}(t) = s(t)$ for each $t \in HU_{\{s, 0\}}, add_{I_5} = (HU_{\{s, 0\}})^3$
 $I_6: D_{I_6} = \{0, 1\}, 0_{I_6} = 0, s_{I_6}(n) = n$ for each $n \in \{0, 1\}, add_{I_6} = \{(m, n, m) \mid m, n \in \{0, 1\}\}$

Logical Truth (I)

 $E \text{ expression} : \Leftrightarrow E \text{ atom, query, clause, or resultant}$

E expression, *I* interpretation, σ state: *E* true in *I* under σ , written: *I* $\models_{\sigma} E$

∶⇔

by case analysis on *E*:

•
$$I \models_{\sigma} p(t_1, ..., t_n) :\Leftrightarrow (\sigma(t_1), ..., \sigma(t_n)) \in p_I$$

- $I \models_{\sigma} A_1, ..., A_n :\iff I \models_{\sigma} A_i$ for every i = 1, ..., n
- $I \models_{\sigma} A \leftarrow \underline{B} : \Leftrightarrow \text{ if } I \models_{\sigma} \underline{B} \text{ then } I \models_{\sigma} A$

•
$$I \models_{\sigma} \underline{\underline{A}} \leftarrow \underline{\underline{B}} : \Leftrightarrow \text{ if } I \models_{\sigma} \underline{\underline{B}} \text{ then } I \models_{\sigma} \underline{\underline{A}}$$

Logical Truth (II)

E expression, *I* interpretation:

Let $x_1, ..., x_k$ be the variables occuring in *E*.

- $\forall x_1, ..., \forall x_k E$ universal closure of *E* (abbreviated $\forall E$)
- $\exists x_1, ..., \exists x_k E$ existential closure of *E* (abbreviated $\exists E$)
- $I \models \forall E : \Leftrightarrow I \models_{\sigma} E$ for every state σ
- $I \models \exists E : \Leftrightarrow I \models_{\sigma} E$ for some state σ
- *E* true in *I* (or: *I* model of *E*), written: $I \models E :\iff I \models \forall E$

Logical Truth (III)

S, *T* sets of expressions, *I* interpretation:

- *I* model of *S*, written: $I \models S : \Leftrightarrow I \models E$ for every $E \in S$
- T semantic (or: logical) consequence of S, written S ⊨ T
 :⇔ every model of S is a model of T

P program, Q_0 query, θ substitution:

- $\theta \mid_{Var(Q_0)}$ correct answer substitution of $Q_0 : \Leftrightarrow P \models Q_0 \theta$
- $Q_0 \theta$ correct instance of $Q_0 : \Leftrightarrow P \models Q_0 \theta$

Models (Example)

Let P_{add} "add-program" and let I_1 , I_2 , I_3 , I_4 , I_5 , and I_6 be the interpretations from slide 8.

• $I_1 \models P_{add}$ (since $I_1 \models_{\sigma} c$ for every clause $c \in P_{add}$ and state $\sigma : V \to \mathbb{N}$: (i) $(\sigma(x), \sigma(0), \sigma(x)) \in add_{I_1}$ and (ii) if $(\sigma(x), \sigma(y), \sigma(z)) \in add_{I_1}$ then $(\sigma(x), \sigma(y)+1, \sigma(z)+1) \in add_{I_1}$)

•
$$I_2 \not\models P_{add}$$
 (e.g. let $\sigma(x) = 1$, then $I_2 \not\models_{\sigma} add(x, 0, x)$
since $(\sigma(x), \sigma(0), \sigma(x)) = (1, 0, 1) \notin add_{I_2}$

• $I_3 \models P_{add}$ (like for I_1 ; we call I_3 a (least) Herbrand model)

•
$$I_4 \not\models P_{add}$$
 (e.g. let $\sigma(x) = s(0)$, then $I_4 \not\models_{\sigma} add(x, 0, x)$
since $(\sigma(x), \sigma(0), \sigma(x)) = (s(0), 0, s(0)) \notin add_{I_4}$

- $I_5 \models P_{add}$ (like for I_1 ; we call I_5 a Herbrand model)
- $I_6 \models P_{add}$ (like for I_1)

Semantic Consequences (Example)

Let P_{add} "add-program".

• $P_{add} \models add(x, 0, x)$

(for every interpretation *I* : if $I \models P_{add}$ then $I \models add(x, 0, x)$, since $add(x, 0, x) \in P_{add}$)

- $P_{add} \models add(x, s(0), s(x))$ (for every interpretation *I* : if $I \models P_{add}$ then $I \models add(x, 0, x)$ and $I \models add(x, s(0), s(x)) \leftarrow add(x, 0, x)$ (instance of clause), thus $I \models add(x, s(0), s(x))$)
- $P_{add} \not\models add(0, x, x)$ (consider interpretation I_6 from slide 8 with $I_6 \not\models P_{add}$; $I_6 \not\models add(0, x, x)$, since e.g. $I_6 \not\models_{\sigma} add(0, x, x)$ for $\sigma(x) = 1$, since $(\sigma(0), \sigma(x), \sigma(x)) = (0, 1, 1) \notin add_{I_6}$

Towards Soundness of SLD-Resolution (I)

Lemma 4.3 (i)

Let $Q \stackrel{\theta}{\underset{c}{\longrightarrow}} Q$ ' be an SLD-derivation step and $Q\theta \leftarrow Q$ ' the resultant associated with it. Then $c \models Q\theta \leftarrow Q'$

Proof.

Let $Q = \underline{A}$, B, \underline{C} with selected atom B. Let $H \leftarrow \underline{B}$ be the input clause and $Q' = (\underline{A}, \underline{B}, \underline{C})\theta$. Then

	c	(variant of c)
implies	$c \models H\theta \leftarrow \underline{\underline{B}}\theta$	(instance)
implies	$c \models B\theta \leftarrow \underline{B}\theta$	(θ unifier)
implies	$c \models (\underline{A}, B, \underline{C})\theta \leftarrow (\underline{A}, \underline{B}, \underline{C})\theta$	("context" unchanged)

Towards Soundness of SLD-Resolution (II)

Lemma 4.3 (ii)

Let ξ be an SLD-derivation of $P \cup \{Q_0\}$. For $i \ge 0$ let R_i be the resultant of level i of ξ . Then $P \models R_i$

Proof.
Let
$$\xi = Q_0 \xrightarrow{\theta_1} Q_1 \dots Q_n \xrightarrow{\theta_{n+1}} Q_{n+1} \dots$$
 Induction on $i \ge 0$:
 $i = 0$: $R_0 = Q_0 \leftarrow Q_0 =$ "true", thus $P \models R_0$
 $i = 1$: $R_1 = Q_0 \theta_1 \leftarrow Q_1$; by Lemma 4.3 (i): $P \models R_1$
 $i \ge i + 1$: $R_{i+1} = Q_0 \theta_1 \dots \theta_{i+1} \leftarrow Q_{i+1}$ is a semantic consequence of resultant $Q_i \theta_{i+1} \leftarrow Q_{i+1}$
associated with $(i + 1)$ -st derivation step and $R_i \theta_{i+1} = Q_0 \theta_1 \dots \theta_{i+1} \leftarrow Q_i \theta_{i+1}$, thus
by Lemma 4.3 (i) and induction hypothesis: $P \models R_{i+1}$

Soundness of SLD-Resolution

Theorem 4.4

If there exists a successful SLD-derivation of $P \cup \{Q_0\}$ with CAS θ , then $P \models Q_0 \theta$.

Proof. $\theta_1 \quad \theta_n$ Let $\xi = Q_0 \Longrightarrow \dots \Longrightarrow \square$ be successful SLD-derivation. Lemma 4.3 (ii) applied to the resultant of level *n* of ξ implies $P \models Q_0 \theta_1 \dots \theta_n$ and $Q_0 \theta_1 \dots \theta_n = Q_0(\theta_1 \dots \theta_n |_{Var(Q_0)}) = Q_0 \theta.$

Comparison to Intuitive Meaning of Queries

Corollary 4.5

If there exists a successful SLD-derivation of $P \cup \{Q_0\}$, then $P \models \exists Q_0$.

Proof.

```
Theorem 4.4 implies P \models Q_0 \theta for some CAS \theta.
```

```
Then, P \models Q_0 \theta
```

```
implies for every interpretation I: if I \models P, then I \models Q_0 \theta
implies for every interpretation I: if I \models P, then I \models \forall (Q_0 \theta)
implies for every interpretation I: if I \models P, then I \models \exists Q_0
implies P \models \exists Q_0
```

Towards Completeness of SLD-Resolution

To show completeness of SLD-resolution we need to syntactically characterize the set of semantically derivable queries.

The concepts of term models and implication trees serve this purpose.

Term Models

V set of variables, *F* function symbols, \prod predicate symbols:

The term algebra *J* for *F* is defined as follows:

- 1. domain $D = TU_{F,V}$
- 2. mapping $f_J : (TU_{F,V})^n \to TU_{F,V}$ assigned to every $f \in F^{(n)}$ with $f_J(t_1, ..., t_n) \Leftrightarrow f(t_1, ..., t_n)$

A term interpretation *I* for *F* and \prod consists of:

- 1. term algebra for F
- 2. $I \subseteq TB_{\prod,F,V}$ (set of atoms that are true; equivalent: assignment of a relation $p_I \subseteq (TU_{F,V})^n$ to every $p \in \prod^{(n)}$)

I term model of a set S of expressions : \Leftrightarrow *I* term interpretation and model of S

Foundations of Logic Programming

Declarative Interpretation

Herbrand Models

The Herbrand algebra *J* for *F* is defined as follows:

- 1. domain $D = HU_F$
- 2. mapping $f_J : (HU_F)^n \to HU_F$ assigned to every $f \in F^{(n)}$ with $f_J(t_1, ..., t_n) \Leftrightarrow f(t_1, ..., t_n)$

A Herbrand interpretation *I* for *F* and \prod consists of:

- 1. Herbrand algebra for F
- 2. $I \subseteq HB_{\prod,F}$ (set of ground atoms that are true)

I Herbrand model of a set S of expressions : \Leftrightarrow *I* Herbrand interpretation and model of S

I least Herbrand model of a set S of expressions

: \Leftrightarrow / Herbrand model of S and / \subseteq /' for all Herbrand models /' of S

Implication Trees

implication tree w.r.t. program P

∶⇔

- finite tree whose nodes are atoms
- if A is a node with the direct descendants $B_1, ..., B_n$ then $A \leftarrow B_1, ..., B_n \in inst(P)$
- if A is a leaf, then $A \leftarrow \in inst(P)$

E expression, *S* set of expressions:

- $inst(E) : \Leftrightarrow$ set of all instances of E
- *inst*(S) : \Leftrightarrow set of all instances of Elements $E \in S$
- ground(E) : \Leftrightarrow set of all ground instances of E
- ground(S) : \Leftrightarrow set of all ground instances of Elements $E \in S$

Foundations of Logic Programming

Declarative Interpretation

Implication Trees (Example)

Let P_{add} "add-program", $n \in \mathbb{N}$, V set of variables, $t \in TU_{\{s,0\},V}$, and

$$\mathcal{T} = add(t, s^{n}(0), s^{n}(t)) \\ | \\ add(t, s^{n-1}(0), s^{n-1}(t)) \\ \vdots \\ add(t, s(0), s(t)) \\ | \\ add(t, 0, t)$$

If $t \in HU_{\{s,0\}}$, then \mathcal{T} is ground implication tree w.r.t. P_{add} .

Implication Trees Constitute Term Model

Lemma 4.7

Consider term interpretation *I*, atom *A*, program *P*

- $I \models A \text{ iff } inst(A) \subseteq I$
- $I \models P$ iff for every $A \leftarrow B_1, ..., B_n \in inst(P)$: if $\{B_1, ..., B_n\} \subseteq I$ then $A \in I$

Lemma 4.12

The term interpretation

 $\mathcal{C}(P)$: \Leftrightarrow {A | A is the root of some implication tree w.r.t. P} is a model of P.

Ground Implication Trees Constitute Herbrand Model

Lemma 4.26

Consider Herbrand interpretation I, atom A, program P

- $I \models A \text{ iff } ground(A) \subseteq I$
- $I \models P$ iff for every $A \leftarrow B_1, ..., B_n \in ground(P), \{B_1, ..., B_n\} \subseteq I$ implies $A \in I$

Lemma 4.28

The Herbrand interpretation

 $\mathcal{M}(P)$: \Leftrightarrow { $A \mid A$ is the root of some ground implication tree w.r.t. P} is a model of P.

Example

Let P_{add} "add-program", and V set of variables.

The term interpretation

$$\begin{aligned} \mathcal{C}(P_{add}) &= \{ add(t, \, s^n(0), \, s^n(t)) \mid n \in \mathbb{N}, \, t \in TU_{\{s,0\},V} \} \\ &= \{ add(s^m(v), \, s^n(0), \, s^{n+m}(v)) \mid m, \, n \in \mathbb{N}, \, v \in V \cup \{0\} \} \end{aligned}$$

and the Herbrand interpretation

$$\mathcal{M}(P_{add}) = \{add(t, s^{n}(0), s^{n}(t)) \mid n \in \mathbb{N}, t \in HU_{\{s,0\}}\}$$

$$= \{add(s^{m}(0), s^{n}(0), s^{n+m}(0)) \mid m, n \in \mathbb{N}\}$$

are models of P_{add} .

Correct Answer Substitutions versus Computed Answer Substitutions (Example)

Let P_{add} "add-program", and Q = add(u, s(0), s(u)) query.

- $\theta = \{u/s^2(v)\}$ correct answer substitution of Q, since $P_{add} \models Q\theta = add(s^2(v), s(0), s^3(v))$ (in analogy to slide 13 with $x = s^2(v)$).
- SLD-derivation of $P_{add} \cup \{Q\}$: $\theta_1 \qquad \theta_2$ $add(u, s(0), s(u)) \Longrightarrow add(u, 0, u) \Longrightarrow \Box$ with $\theta_1 = \{x/u, y/0, z/u\}$ and $\theta_2 = \{x/u\}$, thus $\eta = (\theta_1 \theta_2)|_{\{u\}} = \epsilon$ is a computed answer substitution of Q.
- Thus, $Q\eta$ more general than $Q\theta$.
- In fact, no SLD-derivation of $P_{add} \cup \{Q\}$ can deliver correct answer substitution θ .

Foundations of Logic Programming

Declarative Interpretation

Completeness of SLD-Resolution for Implication Trees

Query *Q* is *n*-deep.

∶⇔

every atom in *Q* is the root of an implication tree, and *n* is the total number of nodes in these trees

Lemma 4.15

Suppose $Q\theta$ is *n*-deep for some $n \ge 0$. Then for every selection rule \mathcal{R} there exists a successful SLD-derivation of $P \cup \{Q\}$ with CAS η such that $Q\eta$ is more general than $Q\theta$.

Completeness of SLD-Resolution (I)

Theorem 4.13

Suppose that θ is a correct answer substitution of Q. Then for every selection rule \mathcal{R} there exists a successful SLD-derivation of $P \cup \{Q\}$ with CAS η such that $Q\eta$ is more

general than $Q\theta$.

Proof. Let $Q = A_1, ..., A_m$. Then: θ correct answer substitution of $A_1, ..., A_m$ implies $P \models A_1 \theta, ..., A_m \theta$ implies for every interpretation *I*: if $I \models P$, then $I \models A_1 \theta, ..., A_m \theta$ implies $C(P) \models A_1 \theta, ..., A_m \theta$ (since $C(P) \models P$ by Lemma 4.12) implies $inst(A_i \theta) \subseteq C(P)$ for every i = 1, ..., m (by Lemma 4.7) implies $A_i \theta \in C(P)$ for every i = 1, ..., mimplies $A_1 \theta, ..., A_m \theta$ is *n*-deep for some $n \ge 0$ (by def. of C(P)) implies claim (by Lemma 4.15)

Completeness of SLD-Resolution (II)

Corollary 4.16

Suppose $P \models \exists Q$.

Then there exists a successful SLD-derivation of $P \cup \{Q\}$.

Proof. $P \models \exists Q$ implies $P \models Q\theta$ for some substitution θ implies θ correct answer substitution of Qimplies claim (by Theorem 4.13)

Least Herbrand Model

Theorem 4.29 $\mathcal{M}(P)$ is the least Herbrand model of P. Proof. Let *I* be a Herbrand model of *P* and let $A \in \mathcal{M}(P)$. We prove $A \in I$ by induction on the number *i* of nodes in the ground implication tree w.r.t. P with root A. Then $\mathcal{M}(P) \subseteq I$. *i* = 1: *A* leaf implies $A \leftarrow \in ground(P)$ implies $I \models A$ (since $I \models P$) implies $A \in I$ $i \sim i+1$: A has direct descendants $B_1, ..., B_n$ (roots of subtrees) implies $A \leftarrow B_1, ..., B_n \in ground(P)$ and $B_1, ..., B_n \in I$ (induction hypothesis) implies $A \leftarrow B_1, ..., B_n \in ground(P)$ and $I \models B_1, ..., B_n$ implies $I \models A$ (since $I \models P$) implies $A \in I$

Ground Equivalence

Theorem 4.30 For every ground atom A: $P \models A$ iff $\mathcal{M}(P) \models A$. Proof. "only if": $P \models A$ and $\mathcal{M}(P) \models P$ implies $\mathcal{M}(P) \models A$ (semantic consequence). "if": Show for every interpretation *I*: $I \models P$ implies $I \models A$. Let $I_{H} = \{A \mid A \text{ ground atom and } I \models A\}$ Herbrand interpretation. $I \models P$ implies $I \models B \leftarrow B_1, ..., B_n$ for all $B \leftarrow B_1, ..., B_n \in ground(P)$ implies if $I \models B_1, ..., I \models B_n$ then $I \models B$ for all ... implies if $B_1 \in I_H$, ..., $B_n \in I_H$ then $B \in I_H$ for all ... (Def. I_H) implies $I_{\mu} \models P$ (by Lemma 4.26; thus I_{μ} Herbrand model) implies $A \in I_H$ (since $A \in \mathcal{M}(P)$ and $\mathcal{M}(P)$ least Herbrand model) implies $I \models A$ (by Def. I_{μ})

Complete Partial Orderings

Let $(\mathcal{A}, \sqsubseteq)$ be a partial ordering (cf. Slide 18 for Chapter 2).

- a least element of X ⊆ A
 :⇔ a ∈ X, a ⊆ x for all x ∈ X
- a least upper bound of X ⊆ A (Notation: $a = \sqcup X$)
 :⇔ $a \in A$, x ⊆ a for all x ∈ X and a is the least element of A with this property

 $(\mathcal{A}, \sqsubseteq)$ complete partial ordering (CPO) : \Leftrightarrow

- A contains a least element (denoted by \emptyset)
- for every increasing sequence a₀ ⊆ a₁ ⊆ a₂ ... of elements of A, the set X = {a₀, a₁, a₂, ...} has a least upper bound

Some Properties of Operators

```
Let (\mathcal{A}, \sqsubseteq) be a cpo.
operator T: \mathcal{A} \to \mathcal{A} monotonic
:\Leftrightarrow I \sqsubseteq J implies T(I) \sqsubseteq T(J)
operator T: \mathcal{A} \to \mathcal{A} finitary
:\Leftrightarrow for every infinite sequence I_0 \sqsubseteq I_1 \sqsubseteq ..., I_{n=0}^{\infty} T(I_n) is the sequence I_0 \sqsubseteq I_1 \sqsubseteq ..., I_{n=0}^{\infty} T(I_n) is the sequence I_0 \sqsubseteq I_1 \sqsubseteq ..., I_{n=0}^{\infty} T(I_n) is the sequence I_0 \sqsubseteq I_1 \sqsubseteq ..., I_{n=0}^{\infty} T(I_n) is the sequence I_0 \sqsubseteq I_1 \sqsubseteq ..., I_n \vDash I_n is the sequence I_0 \sqsubseteq I_1 \sqsubseteq ..., I_n is the sequence I_0 \sqsubseteq I_1 \sqsubseteq ..., I_n is the sequence I_0 \sqsubseteq I_1 \sqsubseteq ..., I_n is the sequence I_0 \sqsubseteq I_1 \sqsubseteq ..., I_n is the sequence I_0 \sqsubseteq I_1 \sqsubseteq ..., I_n is the sequence I_0 \sqsubseteq I_1 \sqsubseteq ..., I_n is the sequence I_0 \sqsubseteq I_1 \sqsubseteq ..., I_n is the sequence I_0 \sqsubseteq I_1 \sqsubseteq ..., I_n is the sequence I_0 \sqsubseteq I_1 \sqsubseteq ..., I_n is the sequence I_0 \sqsubseteq I_1 \sqsubseteq ..., I_n is the sequence I_0 \sqsubseteq I_1 \sqsubseteq ..., I_n is the sequence I_0 \sqsubseteq I_1 \sqsubseteq ..., I_n is the sequence I_0 \sqsubseteq I_1 \sqsubseteq ..., I_n is the sequence I_0 \sqsubseteq I_1 \sqsubseteq ..., I_n is the sequence I_0 \sqsubseteq I_1 \sqsubseteq ..., I_n is the sequence I_0 \sqsubseteq I_1 \sqsubseteq ..., I_n is the sequence I_0 \sqsubseteq I_1 \sqsubseteq ..., I_n is the sequence I_0 \sqsubseteq I_1 \sqsubseteq ..., I_n is the sequence I_0 \sqsubseteq I_1 \sqsubseteq ..., I_n is the sequence I_0 \sqsubseteq I_1 \sqsubseteq ..., I_n is the sequence I_0 \sqsubseteq I_1 \sqsubseteq ..., I_n is the sequence I_0 \sqsubseteq I_1 \sqsubseteq ..., I_n is the sequence I_0 \sqsubseteq I_1 \sqsubseteq ..., I_n is the sequence I_0 \sqsubseteq I_1 \sqsubseteq ..., I_n is the sequence I_0 \sqsubseteq I_1 \sqsubseteq ..., I_n is the sequence I_0 \sqsubseteq I_1 \amalg I_n is the sequence I_0 \amalg I_n is the sequence I_0 \sqsubseteq I_1 \amalg I_n is the sequence I_0 \amalg I_n is the sequence I_0
```

operator $T: \mathcal{A} \to \mathcal{A}$ continuous : $\Leftrightarrow T$ monotonic and finitary

I pre-fixpoint of $T :\Leftrightarrow T(I) \sqsubseteq I$ *I* fixpoint of $T :\Leftrightarrow T(I) = I$

Iterating Operators

Let
$$(\mathcal{A}, \sqsubseteq)$$
 be a CPO, $T: \mathcal{A} \to \mathcal{A}$, and $I \in \mathcal{A}$.
• $T^{0}(I) :\Leftrightarrow I$
• $T^{(n+1)}(I) :\Leftrightarrow T(T^{n}(I))$
• $T^{w}(I) :\Leftrightarrow \sqcup_{n=0}^{\infty} T^{n}(I)$
 $T^{a} :\Leftrightarrow T^{a}(\emptyset) \quad \text{(for } a = 0, 1, 2, ..., w)$
By the definition of a CPO:
If the sequence $T^{0}(I), T^{1}(I), T^{2}(I), ...$ is increasing, then $T^{w}(I)$ exists.

Theorem 4.22

If *T* is a continuous operator on a CPO, then T^w exists and is the least prefixpoint of *T* and the least fixpoint of *T*.

Consequence Operator

Consider the CPO ({*I* | *I* Herbrand interpretation}, \subseteq). Let *P* be a program and *I* a Herbrand interpretation. Then $T_P(I) : \Leftrightarrow \{A \mid A \leftarrow B_1, ..., B_n \in ground(P), \{B_1, ..., B_n\} \subseteq I\}$

Lemma 4.33

- (i) T_P is finitary.
- (ii) T_P is monotonic.

T_P -Characterization

Lemma 4.32

A Herbrand interpretation *I* is a model of *P* iff $T_P(I) \subseteq I$

Proof.

$$I \models P$$

iff for every $A \leftarrow B_1, ..., B_n \in ground(P)$:
 $\{B_1, ..., B_n\} \subseteq I$ implies $A \in I$ (by Lemma 4.26)
iff for every ground atom $A: A \in T_P(I)$ implies $A \in I$
iff $T_P(I) \subseteq I$

Characterization Theorem

Theorem 4.34

- $\mathcal{M}(P)$ (i)
- = least Herbrand model of *P* (ii)
- = least pre-fixpoint of T_P (iii)
- = least fixpoint of T_P (iv)

$$= T_P^{w}$$
 (v)

= { $A \mid A \text{ ground atom}, P \models A$ } (vi)

Success Sets

```
success set of a program P : \Leftrightarrow
{A | A ground atom, \exists successful SLD-derivation of P \cup \{A\} }
```

Theorem 4.37

For a ground atom A, the following are equivalent:

Objectives

- Algebras (which provide a semantics of terms)
- Interpretations (which provide a semantics of programs)
- Soundness of SLD-resolution
- Completeness of SLD-resolution
- Least Herbrand models
- Computing least Herbrand models
