Complexity Theory Exercise 10: Randomised Computation 16 January 2019

Exercise 10.1. Show that **MAJSAT** is in PP.

 $\mathbf{MaJSat} = \{ \varphi \mid \varphi \text{ is some propositional logic formula that} \\ \text{ is satisfied by more than half of its assignments} \}$

Exercise 10.2. Show BPP = COBPP.

* **Exercise 10.3.** Show $BPP^{BPP} = BPP$.

Exercise 10.4. Find the error in the following proof that shows PP = BPP: Let $L \in PP$. Then there exists a poly-time bounded PTM accepting L with error probability smaller than $\frac{1}{2}$. Using error amplification, we can make this error arbitrarily small, and in particular smaller than $\frac{1}{3}$. Hence, $L \in BPP$.

Exercise 10.5. Let \mathcal{M} be a polynomial-time probabilistic Turing machine. We say that \mathcal{M} has *error probability smaller than* $\frac{1}{3}$ if and only if

$$\Pr[\mathcal{M} \text{ accepts } w] < \frac{1}{3} \quad \text{or} \quad \Pr[\mathcal{M} \text{ accepts } w] \ge \frac{2}{3}$$

for all inputs w. Show that deciding whether a polynomial-time probabilistic TM has error probability smaller than $\frac{1}{3}$ is undecidable.
