## Algorithmic problems for query languages

Evaluation problem: Given a query $\mathbf{Q}$, a database instance $\mathbf{d b}$, and a tuple $\mathbf{t}$, is $\mathbf{t} \in \mathbf{Q}(\mathbf{d b})$ ?
$w \rightarrow$ How hard is it to retrieve data?
Based on slides by D. Figueira, G. Puppis, A.Dawar

## Algorithmic problems for query languages

Evaluation problem: Given a query $\mathbf{Q}$, a database instance $\mathbf{d b}$, and a tuple $\mathbf{t}$, is $\mathbf{t} \in \mathbf{Q}(\mathbf{d b})$ ?
$\sim$ How hard is it to retrieve data?

Emptiness problem: Given a query $\mathbf{Q}$, is there a database instance db so that $\mathbf{Q}(\mathbf{d b}) \neq \varnothing$ ?
$\leadsto$ Does Q make sense? Is it a contradiction? (Query optimization)

## Algorithmic problems for query languages

Evaluation problem: Given a query $\mathbf{Q}$, a database instance $\mathbf{d b}$, and a tuple $\mathbf{t}$, is $\mathbf{t} \in \mathbf{Q}(\mathbf{d b})$ ?
$\rightarrow$ How hard is it to retrieve data?

Emptiness problem: Given a query $\mathbf{Q}$, is there a database instance db so that $\mathbf{Q}(\mathbf{d b}) \neq \varnothing$ ?
$\rightsquigarrow$ Does Q make sense? Is it a contradiction? (Query optimization)

Equivalence problem: Given queries $\mathbf{Q}_{1}, \mathbf{Q}_{2}$, is

$$
\mathrm{Q}_{1}(\mathrm{db})=\mathrm{Q}_{2}(\mathrm{db})
$$

for all database instances $d b$ ?
$\leadsto$ Can we safely replace a query with another? (Query optimization)

Proof: By reduction from the Domino (aka Tiling) problem.
Reduction from P to $\mathrm{P}^{\prime}$ : Algorithm that solves P using a $\mathrm{O}(1)$ procedure
" $P^{\prime}(x)$ "
that returns the truth value of $\mathrm{P}^{\prime}(\mathrm{x})$.

## The (undecidable) Domino problem

Domino
Input: 4-sided dominos:

## The (undecidable) Domino problem

Domino
Input: 4-sided dominos:

Output: Is it possible to form a white-bordered rectangle? (of any size)

## The (undecidable) Domino problem

Domino
Input: 4-sided dominos:

Output: Is it possible to form a white-bordered rectangle? (of any size)

Rules: sides must match, you can't rotate the dominos, but you can 'clone' them.

## The (undecidable) Domino problem

- Domino - Why is it undecidable?

It can easily encode halting computations of Turing machines:

## The (undecidable) Domino problem

\end{array} \quad \text { Output: } \mathrm{G} \xi_{\alpha} \phi\right. \text { ? }
$$

use 4 pointers $\leadsto$ LOGSPACE

- If $\phi\left(\mathrm{x}_{1}, \ldots, \mathrm{x}_{\mathrm{n}}\right)=\psi\left(\mathrm{x}_{1}, \ldots, \mathrm{x}_{\mathrm{n}}\right) \wedge \psi^{\prime}\left(\mathrm{x}_{1}, \ldots, \mathrm{x}_{\mathrm{n}}\right)$ : answer YES iff $G F_{\alpha} \psi$ and $G F_{\alpha} \psi^{\prime}$
$\left.\left.\leadsto \operatorname{MAX}\left(\operatorname{SPACE}\left(G \vDash_{\alpha} \psi\right)\right), \operatorname{SPACE}\left(G \vDash_{\alpha} \psi^{\prime}\right)\right)\right)$
- If $\phi\left(\mathrm{x}_{1}, \ldots, \mathrm{x}_{\mathrm{n}}\right)=\neg \psi\left(\mathrm{x}_{1}, \ldots, \mathrm{x}_{\mathrm{n}}\right)$ : answer NO iff $G \not \vDash_{\alpha} \psi$
- If $\phi\left(\mathrm{x}_{1}, \ldots, \mathrm{x}_{\mathrm{n}}\right)=\exists \mathrm{y} \cdot \psi\left(\mathrm{x}_{1}, \ldots, \mathrm{x}_{\mathrm{n}}, \mathrm{y}\right)$ :
answer YES iff for some $v \in V$ and $\alpha^{\prime}=\alpha \cup\{y \mapsto v\}$
$\rightarrow 2 \cdot \log (|\mathrm{G}|)+\operatorname{SPACE}\left(\mathrm{G} \vDash_{\alpha^{\prime}} \psi\right)$ we have $G F_{\alpha^{\prime}} \psi$.

## Question:

$2 \cdot \log (|\mathrm{G}|)+\cdots+2 \cdot \log (|\mathrm{G}|)+\mathrm{k} \cdot \log (|\alpha|+|\mathrm{G}|)$ space
How much space does it take?

## Combined, Query, and Data complexities

A database of size $10^{6}$
Problem: Usual scenario in database
A query of size 100

Input:

## Combined, Query, and Data complexities

A database of size $10^{6}$
Problem: Usual scenario in database
A query of size 100

Input: • query +

## Combined, Query, and Data com

## Problem: Usual scen <br> Input: • query +

 database
## Combined, Query, and Data com

## database

But we don't distinguish this in the analysis:

## TIME(2|query $+\mid$ data $\mid)$ <br> $$
=
$$ <br> TIME (|query $\left.\mid+2^{\text {data }}\right)$

## Combined, Query, and Data complexities

## Query and data play very different roles.

Separation of concerns: How the resources grow with respect to

- the size of the data
- the query size

## Combined, Query, and Data complexities

Combined complexity: input size is $\mid$ query $|+|$ data $\mid$
Query complexity (|data| fixed): input size is |query|
Data complexity (|query| fixed): input size is |data|

## Combined, Query, and Data complexities

Combined complexity: input size is $\mid$ query $|+|$ data $\mid$
Query complexity (|data| fixed): input size is |query|
Data complexity (|query| fixed): input size is |data|

$$
\left.\begin{array}{ll} 
& \begin{array}{l}
\text { exponential in combined complexity } \\
\mathrm{O}\left(2^{\mid q u e r y} \mid\right. \\
\text { exponential in query complexity }
\end{array} \\
& \text { linear in data complexity }
\end{array}\right) \text { is } \begin{aligned}
& \text { exponential in combined complexity } \\
& \mathrm{O}\left(\mid \text { query } \left\lvert\,+2^{\mid \text {data| }) \text { is }} \begin{array}{l}
\text { linear in query complexity } \\
\text { exponential in data complexity }
\end{array}\right.\right.
\end{aligned}
$$

## Question

What is the data, query and combined complexity for the evaluation problem for FO?

Remember: data complexity, input size: |data| query complexity, input size: |query|
combined complexity, input size: $\mid$ data $\mid$ + |query $\mid$

$$
|\phi| \cdot 2 \cdot \log (|G|)+k \cdot \log (|\alpha|+|G|) \text { space }
$$

## Question

What is the data, query and combined complexity for the evaluation problem for FO ?

Remember: data complexity, input size: |data| query complexity, input size: |query| combined complexity, input size: |data| + |query|

$\mathrm{O}(\log (\mid$ data $\mid) \cdot \mid$ query $\mid)$ space
PSPACE combined and query complexity
LOGSPACE data complexity

## Bounded Degree

$\mathcal{D}_{k}$-the class of structures $\mathbb{A}$ in which every element has at most $k$ neighbours in $G \mathbb{A}$.
Theorem (Seese)

For every sentence $\varphi$ of FO and every $k$ there is a linear time algorithm which, given a structure $\mathbb{A} \in \mathcal{D}_{k}$ determines whether $\mathbb{A} \vDash \varphi$.

Note: this is not true for MSO unless $P=N P$.
The proof is based on locality of first-order logic. Specifically, Hanf's theorem.

## Hanf Types

For an element $a$ in a structure $\mathbb{A}$, define $N_{r}^{\mathbb{A}}(a)$ —the substructure of $\mathbb{A}$ generated by the elements whose distance from $a(i n G \mathbb{A}$ ) is at most $r$.

We say $\mathbb{A}$ and $\mathbb{B}$ are Hanf equivalent with radius $r$ and threshold $q$ $\left(\mathbb{A} \simeq_{r, q} \mathbb{B}\right)$ if, for every $a \in A$ the two sets

$$
\left\{a^{\prime} \in A \mid N_{r}^{\mathbb{A}}(a) \cong N_{r}^{\mathbb{A}}\left(a^{\prime}\right)\right\} \quad \text { and } \quad\left\{b \in B \mid N_{r}^{\mathbb{A}}(a) \cong N_{r}^{\mathbb{B}}(b)\right\}
$$

either have the same size or both have size greater than $q$; and, similarly for every $b \in B$.

## Hanf Locality Theorem

Theorem (Hanf)
For every vocabulary $\sigma$ and every $p$ there qre $r$ and $q$ such that for any $\sigma$-structures $\mathbb{A}$ and $\mathbb{B}$ : if $\mathbb{A} \simeq_{r, q} \mathbb{B}$ then $\mathbb{A} \equiv p \mathbb{B}$.

For $\mathbb{A} \in \mathcal{D}_{k}$ :
$N_{r}^{\mathbb{A}}(a)$ has at most $k^{r}+1$ elements
each $\simeq_{r, q}$ has finite index.
Each $\simeq_{r, q^{-}}$class $t$ can be characterised by a finite table, $I_{t}$, giving isomorphism types of neighbourhoods and numbers of their occurrences up to threshold $q$.

## Satisfaction on $\mathcal{D}_{k}$

For a sentence $\varphi$ of FO, we can compute a set of tables $\left\{I_{1}, \ldots, I_{s}\right\}$ describing $\simeq_{r, q}$-classes consistent with it.
This computation is independent of any structure $\mathbb{A}$.
Given a structure $\mathbb{A} \in \mathcal{D}_{k}$,
for each $a$, determine the isomorphism type of $N_{r}^{\mathbb{A}}(a)$
construct the table describing the $\simeq_{r, q}$-class of $\mathbb{A}$.
compare against $\left\{I_{1}, \ldots, I_{s}\right\}$ to determine whether $\mathbb{A} \models \varphi$.
For fixed $k, r, q$, this requires time linear in the size of $\mathbb{A}$.
Note: evaluation for FO is in $O(f(l, k) n)$.

[^0]:    $\longrightarrow$ TIME-bounded by a polynomial
    LOGSPACE $\subseteq$ PTIME $\subseteq$ PSPACE $\subseteq$ EXPTIME $\subseteq \ldots$
    $\longrightarrow$ SPACE-bounded by $\log (\mathrm{n})$
