TU Dresden, 7th May 2019

#### Review: Treewidth

Graphs of bounded treewidth as a generalisation of (undirected) trees:

- Trees have treewidth 1
- Graphs of higher treewidth resemble trees with "thicker branches"
- It is (in theory) not hard to check if a graph has treewidth  $\leq k$  for some k
- It is (in theory) not hard to answer BCQs whose primal graph has a bounded treewidth

Practically feasible only for lower treewidths

However, bounded treewidth does not generalise the notion of hypergraph acyclicity (acyclic families of hypergraphs may have unbounded treewidth)

Is there a better notion of tree-likeness for hypergraphs?

## Query Width

#### Idea of Chekuri and Rajamaran [1997]:

- Create tree structure similar to tree decomposition
- But consider bags of query atoms instead of bags of variables
- Two connectedness conditions:
  - (1) Bags that refer to a certain variable must be connected
  - (2) Bags that refer to a certain query atom must be connected

Query width: least number of atoms needed in bags of a query decomposition

## Query Width

#### Idea of Chekuri and Rajamaran [1997]:

- Create tree structure similar to tree decomposition
- But consider bags of query atoms instead of bags of variables
- Two connectedness conditions:
  - (1) Bags that refer to a certain variable must be connected
  - (2) Bags that refer to a certain query atom must be connected

Query width: least number of atoms needed in bags of a query decomposition

**Theorem 8.1:** Given a query decomposition for a BCQ, the query answering problem can be decided in time polynomial in the query width.

#### Problems with Query Width

**Theorem 8.2 (Gottlob et al. 1999):** Deciding if a query has query width at most k is NP-complete.

In particular, it is also hard to find a query decomposition

- $\rightarrow$  Query answering complexity drops from NP to P  $\dots$ 
  - ...but we need to solve another NP-hard problem first!

## Generalised Hypertree Width

Gottlob, Leone, and Scarcello had another idea on defining tree-like hypergraphs:

#### Intuition:

- Combine key ideas of tree decomposition and query decomposition
- Start by looking at a tree decomposition
- But define the width based on query atoms:
  How many atoms do we need to cover all variables in a bag?
- → Generalised hypertree width
- → A technical condition is needed to get a simpler-to-check notion

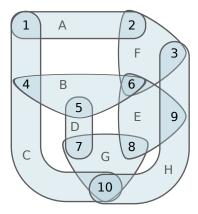

#### Hypertree Width

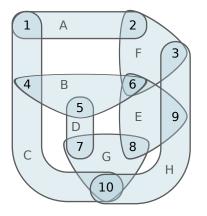

**Definition 8.3:** Consider a hypergraph  $G = \langle V, E \rangle$ . A hypertree decomposition of G is a tree structure T where each node n of T is associated with a bag of variables  $B_n \subseteq V$  and with a set of edges  $G_n \subseteq E$ , such that:

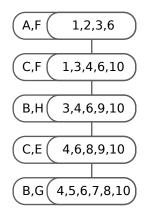

- T with  $B_n$  yields a tree decomposition of the primal graph of G.
- For each node n of T:
  - (1) the vertices used in the edges  $G_n$  are a superset of  $B_n$ ,
  - (2) if a vertex v occurs in an edge of  $G_n$  and this vertex also occurs in  $B_m$  for some node m below n in T, then  $v \in B_n$ .

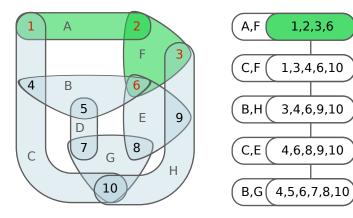

The width to T is the largest number of edges in a set  $G_n$ . The hypertree width of G, hw(G), is the least width of its hypertree decompositions.

((2) is the "special condition": without it we get the generalised hypertree width)

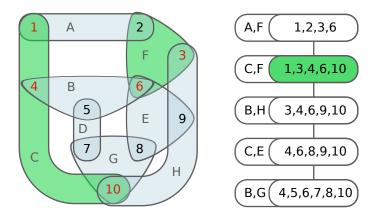

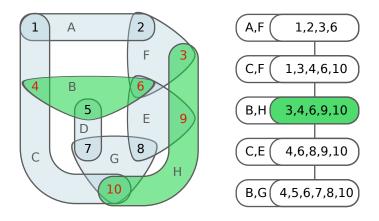

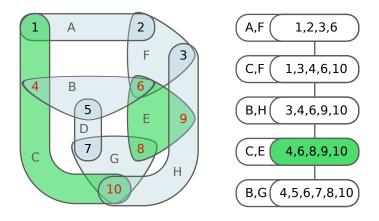

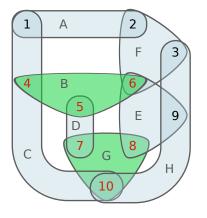

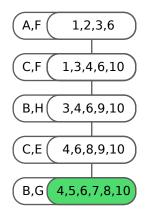

1,2,3,6

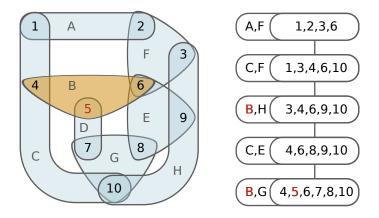

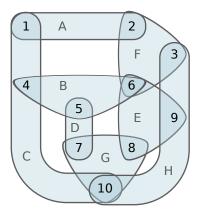

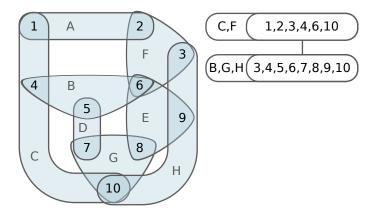

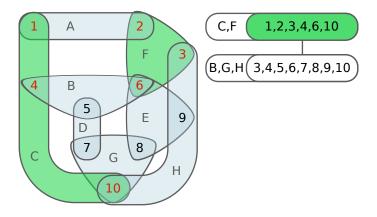

Special condition violated  $\sim$  no hypertree decomposition  $\sim$  But generalised hypertree decomposition of width 2

## Hypertree Width: Observations

**Observation 8.4:** If  $\langle T, (B_n), (G_n) \rangle$  is a hypertree decomposition for a hypergraph  $\langle V, E \rangle$ , then the union of all sets  $G_n$  might be a proper subset of E.

**Proof:** Indeed, we only require that every bag  $B_n$  is "covered" by the edges in  $G_n$ , not that every edge in E is actually used for this purpose.

## Hypertree Width: Observations

**Observation 8.4:** If  $\langle T, (B_n), (G_n) \rangle$  is a hypertree decomposition for a hypergraph  $\langle V, E \rangle$ , then the union of all sets  $G_n$  might be a proper subset of E.

**Proof:** Indeed, we only require that every bag  $B_n$  is "covered" by the edges in  $G_n$ , not that every edge in E is actually used for this purpose.

**Observation 8.5:** If  $\langle T, (B_n), (G_n) \rangle$  is a hypertree decomposition for a hypergraph  $\langle V, E \rangle$ , then, for every hyperedge  $e \in E$ , there is a node n in T such that  $e \subseteq B_n$ .

## Hypertree Width: Observations

**Observation 8.4:** If  $\langle T, (B_n), (G_n) \rangle$  is a hypertree decomposition for a hypergraph  $\langle V, E \rangle$ , then the union of all sets  $G_n$  might be a proper subset of E.

**Proof:** Indeed, we only require that every bag  $B_n$  is "covered" by the edges in  $G_n$ , not that every edge in E is actually used for this purpose.

**Observation 8.5:** If  $\langle T, (B_n), (G_n) \rangle$  is a hypertree decomposition for a hypergraph  $\langle V, E \rangle$ , then, for every hyperedge  $e \in E$ , there is a node n in T such that  $e \subseteq B_n$ .

**Proof:** Since T,  $(B_n)$  is a tree decomposition of the primal graph, and every edge  $e \in E$  gives rise to a |e|-clique in this graph, the variables of e must occur together in one bag of the tree decomposition.

## Complete Hypertree Decompositions

We can make sure that all atoms are in fact used in some set  $G_n$  of the decomposition:

**Theorem 8.6:** If  $\langle T, (B_n), (G_n) \rangle$  is a (generalised) hypertree decomposition for a hypergraph  $\langle V, E \rangle$ , then there is a (generalised) hypertree decomposition  $\langle T', (B'_n), (G'_n) \rangle$  of the same width and of size O(|T| + |E|) such that, for all  $e \in E$ , there is a node n in T' with  $e \in G'_n$ .

## Complete Hypertree Decompositions

We can make sure that all atoms are in fact used in some set  $G_n$  of the decomposition:

**Theorem 8.6:** If  $\langle T, (B_n), (G_n) \rangle$  is a (generalised) hypertree decomposition for a hypergraph  $\langle V, E \rangle$ , then there is a (generalised) hypertree decomposition  $\langle T', (B'_n), (G'_n) \rangle$  of the same width and of size O(|T| + |E|) such that, for all  $e \in E$ , there is a node n in T' with  $e \in G'_n$ .

**Proof:** For every edge  $e \in E$  that does not appear in  $(G_n)$  yet:

- extend T with a new node m that is a child of an existing node n with  $e \subseteq G_n$  (this must exist as just observed)
- define  $B_m = e$  and  $G_m = \{e\}$

This establishes the claim for e and preserves all conditions in the definition of (generalised) hypertree decomposition.

Such hypertree decompositions are called complete.

П

**Theorem 8.7:** A hypergraph is acyclic if and only if it has hypertree width 1.

Markus Krötzsch, 7th May 2019 Database Theory slide 11 of 19

**Theorem 8.7:** A hypergraph is acyclic if and only if it has hypertree width 1.

**Proof:** (*⇒*)

**Theorem 8.7:** A hypergraph is acyclic if and only if it has hypertree width 1.

**Proof:** (⇒) Recall that an acyclic hypergraph has a join tree:

- A tree structure T
- where each node is associated with a single edge
- such that, for any vertex v, the nodes with edges that mention v are a subtree of T

**Theorem 8.7:** A hypergraph is acyclic if and only if it has hypertree width 1.

**Proof:** (⇒) Recall that an acyclic hypergraph has a join tree:

- A tree structure T
- · where each node is associated with a single edge
- such that, for any vertex v, the nodes with edges that mention v are a subtree of T

This easily corresponds to a hypertree decomposition (using the same tree structure, singleton edge sets  $G_n = \{e\}$  and vertex bags  $B_n = e$  if n is associated with e)

**Theorem 8.7:** A hypergraph is acyclic if and only if it has hypertree width 1.

**Proof:**  $(\Leftarrow)$ 

**Theorem 8.7:** A hypergraph is acyclic if and only if it has hypertree width 1.

**Proof:** ( $\Leftarrow$ ) For a hypergraph  $\langle V, E \rangle$ , consider a hypertree decomposition  $\langle T, (B_n), (G_n) \rangle$  of width 1 that is complete (w.l.o.g.).

**Theorem 8.7:** A hypergraph is acyclic if and only if it has hypertree width 1.

**Proof:** ( $\Leftarrow$ ) For a hypergraph  $\langle V, E \rangle$ , consider a hypertree decomposition  $\langle T, (B_n), (G_n) \rangle$  of width 1 that is complete (w.l.o.g.).

We modify the decomposition so that, for every edge  $e \in E$ , there is exactly one node  $n_e$  in T such that  $G_{n_e} = \{e\}$  and  $B_{n_e} = e$ :

- Choose an arbitrary total order < on the nodes of *T*
- For each  $e \in E$ :
  - Find the <-least node  $n_e$  of T with  $G_{n_e} = \{e\}$  and  $B_{n_e} = e$  (exists since we have a complete decomposition of width 1)
  - For every node n with  $G_n = \{e\}$ : re-attach all children of n to  $n_e$  and delete n

**Theorem 8.7:** A hypergraph is acyclic if and only if it has hypertree width 1.

**Proof:** ( $\Leftarrow$ ) For a hypergraph  $\langle V, E \rangle$ , consider a hypertree decomposition  $\langle T, (B_n), (G_n) \rangle$  of width 1 that is complete (w.l.o.g.).

We modify the decomposition so that, for every edge  $e \in E$ , there is exactly one node  $n_e$  in T such that  $G_{n_e} = \{e\}$  and  $B_{n_e} = e$ :

- Choose an arbitrary total order < on the nodes of T
- For each  $e \in E$ :
  - Find the <-least node  $n_e$  of T with  $G_{n_e} = \{e\}$  and  $B_{n_e} = e$  (exists since we have a complete decomposition of width 1)
  - For every node n with  $G_n = \{e\}$ : re-attach all children of n to  $n_e$  and delete n

The modified hypertree decomposition corresponds to a join tree:

- · each node is associated with a single edge
- no edge is associated with more than one node
- the vertices satisfy the connectedness condition for join trees (since *T* is a tree decomposition of the primal graph)

Hence the hypergraph has a join tree and is therefore acyclic.

**Theorem 8.8:** For a BCQ of (generalised) hypertree width k, query answering can be decided in polynomial time (actually in LOGCFL).

**Theorem 8.8:** For a BCQ of (generalised) hypertree width k, query answering can be decided in polynomial time (actually in LOGCFL).

**Proof:** Consider a BCQ q, a width-k hypertree decomposition  $\langle T, (B_n), (G_n) \rangle$  of (the hypergraph of) q, and a database instance  $\mathcal{I}$ .

**Theorem 8.8:** For a BCQ of (generalised) hypertree width k, query answering can be decided in polynomial time (actually in LOGCFL).

**Proof:** Consider a BCQ q, a width-k hypertree decomposition  $\langle T, (B_n), (G_n) \rangle$  of (the hypergraph of) q, and a database instance  $\mathcal{I}$ .

We first construct a modified BCQ q', hypertree decomposition  $\langle T, (B_n), (G'_n) \rangle$  of q', and a database instance  $\mathcal{I}'$ , such that  $\mathcal{I} \models q$  iff  $\mathcal{I}' \models q'$  and  $\bigcup G'_n = B_n$  for all nodes n of T

**Theorem 8.8:** For a BCQ of (generalised) hypertree width k, query answering can be decided in polynomial time (actually in LOGCFL).

**Proof:** Consider a BCQ q, a width-k hypertree decomposition  $\langle T, (B_n), (G_n) \rangle$  of (the hypergraph of) q, and a database instance  $\mathcal{I}$ .

We first construct a modified BCQ q', hypertree decomposition  $\langle T, (B_n), (G'_n) \rangle$  of q', and a database instance I', such that  $I \models q$  iff  $I' \models q'$  and  $\bigcup G'_n = B_n$  for all nodes n of T:

- For each node n and atom  $r(\vec{x}) \in G_n$
- create a new relation r' and let  $\vec{y}$  be a list of all variables in  $\vec{x} \cap B_n$
- replace  $r(\vec{x}) \in G_n$  by  $r'(\vec{y}) \in G'_n$
- define  $r'^{I'}$  as the projection of  $r^I$  to  $\vec{y}$

**Theorem 8.8:** For a BCQ of (generalised) hypertree width k, query answering can be decided in polynomial time (actually in LOGCFL).

**Proof:** Consider a BCQ q, a width-k hypertree decomposition  $\langle T, (B_n), (G_n) \rangle$  of (the hypergraph of) q, and a database instance  $\mathcal{I}$ .

We first construct a modified BCQ q', hypertree decomposition  $\langle T, (B_n), (G'_n) \rangle$  of q', and a database instance  $\mathcal{I}'$ , such that  $\mathcal{I} \models q$  iff  $\mathcal{I}' \models q'$  and  $\bigcup G'_n = B_n$  for all nodes n of T:

- For each node n and atom  $r(\vec{x}) \in G_n$
- create a new relation r' and let  $\vec{y}$  be a list of all variables in  $\vec{x} \cap B_n$
- replace  $r(\vec{x}) \in G_n$  by  $r'(\vec{y}) \in G'_n$
- define  $r'^{I'}$  as the projection of  $r^I$  to  $\vec{y}$

BCQ q', hypertree decomposition  $\langle T, (B_n), (G'_n) \rangle$ , and database instance I' are of size polynomial in the input.

**Theorem 8.8:** For a BCQ of (generalised) hypertree width k, query answering can be decided in polynomial time (actually in LOGCFL).

**Proof:** We claim that  $I \models q$  iff  $I' \models q'$ .

**Theorem 8.8:** For a BCQ of (generalised) hypertree width k, query answering can be decided in polynomial time (actually in LOGCFL).

**Proof:** We claim that  $I \models q$  iff  $I' \models q'$ .

 $(\Rightarrow)$  Every match of q on  $\mathcal{I}$  is also a match of q' on  $\mathcal{I}'$  since

- each atom in q' is just a restriction of an atom in q, and
- the corresponding relation in I' is a projection of the corresponding relation in I

**Theorem 8.8:** For a BCQ of (generalised) hypertree width k, query answering can be decided in polynomial time (actually in LOGCFL).

**Proof:** We claim that  $I \models q$  iff  $I' \models q'$ .

- $(\Rightarrow)$  Every match of q on  $\mathcal{I}$  is also a match of q' on  $\mathcal{I}'$  since
  - each atom in q' is just a restriction of an atom in q, and
  - the corresponding relation in I' is a projection of the corresponding relation in I
- $(\Leftarrow)$  Every match of q' in I' is also a match of q in I since
  - For every atom  $r(\vec{x})$  of q, there is a node n of T with  $\vec{x} \subseteq B_n$  (observed before)
  - so  $r(\vec{x})$  is an atom of q' as well

**Theorem 8.8:** For a BCQ of (generalised) hypertree width k, query answering can be decided in polynomial time (actually in LOGCFL).

**Proof:** We now construct an acyclic BCQ  $\bar{q}$ , database  $\bar{I}$ , and join tree J of  $\bar{q}$ , such that  $I' \models q'$  iff  $\bar{I} \models \bar{q}$ .

**Theorem 8.8:** For a BCQ of (generalised) hypertree width k, query answering can be decided in polynomial time (actually in LOGCFL).

**Proof:** We now construct an acyclic BCQ  $\bar{q}$ , database  $\bar{I}$ , and join tree J of  $\bar{q}$ , such that  $I' \models q'$  iff  $\bar{I} \models \bar{q}$ .

- The tree structure of *J* is the same as *T*
- For each node n of T:
  - we define a corresponding atom  $r_n(\vec{x})$  of  $\bar{q}$  with variables  $\vec{x} = B_n$ ,
  - let  $r_n(\vec{x})$  be the atom at the node of J that corresponds to n, and
  - define  $r_n^I$  to be the natural join of the atoms in  $G'_n$  over I'

**Theorem 8.8:** For a BCQ of (generalised) hypertree width k, query answering can be decided in polynomial time (actually in LOGCFL).

**Proof:** We now construct an acyclic BCQ  $\bar{q}$ , database  $\bar{I}$ , and join tree J of  $\bar{q}$ , such that  $I' \models q'$  iff  $\bar{I} \models \bar{q}$ .

- The tree structure of *J* is the same as *T*
- For each node n of T:
  - we define a corresponding atom  $r_n(\vec{x})$  of  $\bar{q}$  with variables  $\vec{x} = B_n$ ,
  - let  $r_n(\vec{x})$  be the atom at the node of J that corresponds to n, and
  - define  $r_n^{\mathcal{I}}$  to be the natural join of the atoms in  $G'_n$  over  $\mathcal{I}'$

#### Observations:

- The outcome is polynomial in size
- We find  $I' \models q'$  iff  $\bar{I} \models \bar{q}$

**Theorem 8.8:** For a BCQ of (generalised) hypertree width k, query answering can be decided in polynomial time (actually in LOGCFL).

**Proof:** We now construct an acyclic BCQ  $\bar{q}$ , database  $\bar{I}$ , and join tree J of  $\bar{q}$ , such that  $I' \models q'$  iff  $\bar{I} \models \bar{q}$ .

- The tree structure of *J* is the same as *T*
- For each node n of T:
  - we define a corresponding atom  $r_n(\vec{x})$  of  $\bar{q}$  with variables  $\vec{x} = B_n$ ,
  - let  $r_n(\vec{x})$  be the atom at the node of J that corresponds to n, and
  - define  $r_n^{\mathcal{I}}$  to be the natural join of the atoms in  $G'_n$  over  $\mathcal{I}'$

#### Observations:

- The outcome is polynomial in size
- We find  $I' \models q'$  iff  $\bar{I} \models \bar{q}$

The overall claim now follows by applying Yannakakis' Algorithm to answer the query.

**Theorem 8.9:** For a BCQ of (generalised) hypertree width k, query answering can be decided in polynomial time, and is complete for LOGCFL.

 $\dots$  but the degree of the polynomial time bound is greater than k

## Hypertree Width via Games

There is also a game characterisation of (generalised) hypertree width.

#### The Marshals-and-Robber Game

- The game is played on a hypergraph
- There are k marshals, each controlling one hyperedge, and one robber located at a vertex
- Otherwise similar to cops-and-robber game
- Special condition: Marshals must shrink the space that is left for the robber in every turn!

Hypertree width  $\leq k$  if and only if k marshals have a winning strategy

→ hypergraph is acyclic iff 1 marshal has a winning strategy

# Hypertree Width via Logic

There is also a logical characterisation of hypertree width.

#### Loosely k-Guarded Logic

- Fragment of FO with  $\exists$  and  $\land$
- Special form for all ∃ subexpressions:

$$\exists x_1,\ldots,x_n.(G_1\wedge\ldots\wedge G_k\wedge\varphi)$$

where  $G_i$  are atoms ("guards") and every variable that is free in  $\varphi$  occurs in one such atom  $G_i$ .

A query has hypertree width  $\leq k$  if and only if it can be expressed as a loosely k-guarded formula

 $\rightarrow$  tree queries correspond to loosely 1-guarded formulae

("loosely 1-guarded" logic is better known as guarded logic and widely studied)

# Summary and Outlook

Besides tree queries, there are other important classes of CQs that can be answered in polynomial time:

- Bounded treewidth queries
- Bounded hypertree width queries

General idea: decompose the query in a tree structure

Other possible characterisations via games and logic

#### Open questions:

- What else is there besides query answering? → optimisation
- Measure expressivity rather than just complexity
