COMPLEXITY THEORY

Lecture 1: Introduction and Motivation

Markus Krötzsch, Stephan Mennicke, Lukas Gerlach Knowledge-Based Systems

TU Dresden, 9th Oct 2023

More recent versions of this slide deck might be available. For the most current version of this course, see https://iccl.inf.tu-dresden.de/web/Complexity_Theory/en

Course Tutors

Markus Krötzsch Prof

Stephan Mennicke Exercises/Lectures

Lukas Gerlach Exercises/Lectures

Organisation

Lectures Monday, DS 2 (9:20–10:50), REC C-118 Tuesday, DS 2 (9:20–10:50), APB E005

Exercise Sessions (starting 18 October) Wednesday, DS 3 (11:10–12:40), APB E005

Web Page https://iccl.inf.tu-dresden.de/web/Complexity_Theory_(WS2023/24)

Lecture Notes Slides of current and past lectures will be online.

Goals and Prerequisites

Goals

- Introduce basic notions of computational complexity theory
- Introduce **commonly known complexity classes** (P, NP, PSpace, ...) and discuss relationships between them
- Develop tools to classify problems into their corresponding complexity classes
- Introduce some **advanced topics of complexity theory** (e.g., circuits, probabilistic computation, quantum computing)

(Non-)Prerequisites

- No particular prior courses needed
- Prior acquaintance with Turing Machines and basic topics in formal languages and complexity is helpful
- · General mathematical and theoretical computer science skills necessary

Reading List

- Michael Sipser: Introduction to the Theory of Computation, International Edition; 3rd Edition; Cengage Learning 2013
- Sanjeev Arora and Boaz Barak: **Computational Complexity: A Modern Approach**; Cambridge University Press 2009
- Michael R. Garey and David S. Johnson: Computers and Intractability; Bell Telephone Laboratories, Inc. 1979
- Erich Grädel: Complexity Theory; Lecture Notes, Winter Term 2009/10
- John E. Hopcroft and Jeffrey D. Ullman: Introduction to Automata Theory, Languages, and Computation; Addison Wesley Publishing Company 1979
- Christos H. Papadimitriou: **Computational Complexity**; 1995 Addison-Wesley Publishing Company, Inc

Computational Problems are Everywhere

- What are the factors of 54,623?
- · What is the shortest route by car from Berlin to Hamburg?
- My program now runs for two weeks. Will it ever stop?
- Is this C++ program syntactically correct?

Computational Problems are Everywhere

Example 1.1:

- What are the factors of 54,623?
- · What is the shortest route by car from Berlin to Hamburg?
- My program now runs for two weeks. Will it ever stop?
- Is this C++ program syntactically correct?

Clear

Computational Problems are ubiquitous in our everyday life! And, depending on what we want to do, those problems might be either **easily solvable** or **hardly solvable**.

Computational Problems are Everywhere

Example 1.1:

- What are the factors of 54,623?
- What is the shortest route by car from Berlin to Hamburg?
- My program now runs for two weeks. Will it ever stop?
- Is this C++ program syntactically correct?

Clear

Computational Problems are ubiquitous in our everyday life! And, depending on what we want to do, those problems might be either **easily solvable** or **hardly solvable**.

Approach to problems:

[T]he way is to avoid what is strong, and strike at what is weak.

(Sun Tzu: The Art of War, Chapter 6: Weak Points and Strong)

Examples

Easily solvable using, e.g., Dijkstra's Algorithm.

Easily solvable using, e.g., Dijkstra's Algorithm.

Example 1.3 (Longest Path Problem): Given a weighted graph and two vertices s, t, find the **longest** path between s and t.

Easily solvable using, e.g., Dijkstra's Algorithm.

Example 1.3 (Longest Path Problem): Given a weighted graph and two vertices s, t, find the **longest** path between s and t.

No efficient algorithm known, and believed to not exist (this problem is **NP-hard**)

Easily solvable using, e.g., Dijkstra's Algorithm.

Example 1.3 (Longest Path Problem): Given a weighted graph and two vertices s, t, find the **longest** path between s and t.

No efficient algorithm known, and believed to not exist (this problem is NP-hard)

Observation Difficulty of a problem is hard to assess

Measuring the Difficulty of Problems

Question How can we measure the complexity of a problem?

Measuring the Difficulty of Problems

Question

How can we measure the complexity of a problem?

Approach

Estimate the resource requirements of the "best" algorithm that solves this problem.

Typical Resources:

- Running Time
- Memory Used

Measuring the Difficulty of Problems

Question

How can we measure the complexity of a problem?

Approach

Estimate the resource requirements of the "best" algorithm that solves this problem.

Typical Resources:

- Running Time
- Memory Used

Note

To assess the complexity of a problem, we need to consider **all possible algorithms** that solve this problem.

Problems

What actually is ... a Problem?

(Decision) Problems are word problems of particular languages.

Problems

What actually is ... a Problem?

(Decision) Problems are word problems of particular languages.

```
Example 1.4: "Problem: Is a given graph connected?" will be modelled as the word problem of the language
```

 $\mathsf{GCONN} := \{ \langle G \rangle \mid G \text{ is a connected graph } \}.$

Then for a graph G we have

G is connected $\iff \langle G \rangle \in \text{GCONN}.$

Note

The notation $\langle G \rangle$ denotes a suitable encoding of the graph *G* over some fixed alphabet (e.g., { 0, 1 }).

Complexity Theory

What actually is ... an Algorithm?

What actually is ... an Algorithm?

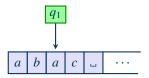

- Turing Machines
- Lambda Calculus

Suppose we are given a language \mathcal{L} and a word w.

Question

Does there need to exist **any** algorithm that decides whether $w \in \mathcal{L}$?

Suppose we are given a language \mathcal{L} and a word w.

Question

Does there need to exist **any** algorithm that decides whether $w \in \mathcal{L}$?

Answer

No. Some problems are **undecidable**.

Suppose we are given a language \mathcal{L} and a word w.

Question

Does there need to exist **any** algorithm that decides whether $w \in \mathcal{L}$?

Answer

No. Some problems are **undecidable**.

Suppose we are given a language \mathcal{L} and a word w.

Question

Does there need to exist **any** algorithm that decides whether $w \in \mathcal{L}$?

Answer

No. Some problems are undecidable.

Example 1.5:

• The Halting Problem of Turing machines

Suppose we are given a language \mathcal{L} and a word w.

Question

Does there need to exist **any** algorithm that decides whether $w \in \mathcal{L}$?

Answer

No. Some problems are undecidable.

- The Halting Problem of Turing machines
- The Entscheidungsproblem (Is a first-order logical statement true?)

Suppose we are given a language \mathcal{L} and a word w.

Question

Does there need to exist **any** algorithm that decides whether $w \in \mathcal{L}$?

Answer

No. Some problems are undecidable.

- The Halting Problem of Turing machines
- The Entscheidungsproblem (Is a first-order logical statement true?)
- Finding the lowest air fare between two cities (→ Reference)

Suppose we are given a language \mathcal{L} and a word w.

Question

Does there need to exist **any** algorithm that decides whether $w \in \mathcal{L}$?

Answer

No. Some problems are undecidable.

- The Halting Problem of Turing machines
- The Entscheidungsproblem (Is a first-order logical statement true?)
- Finding the lowest air fare between two cities (→ Reference)
- Deciding syntactic validity of C++ programs (→ Reference)

Suppose we are given a language \mathcal{L} and a word w.

Question

Does there need to exist **any** algorithm that decides whether $w \in \mathcal{L}$?

Answer

No. Some problems are undecidable.

Example 1.5:

- The Halting Problem of Turing machines
- The Entscheidungsproblem (Is a first-order logical statement true?)
- Finding the lowest air fare between two cities (→ Reference)
- Deciding syntactic validity of C++ programs (\rightarrow Reference)

Avoid: We will focus mostly on decidable problems in this course.

Time and Space

Difficulty

Measuring running time and memory requirements depends highly on the **machine**, and not so much on the **problem**.

Time and Space

Difficulty

Measuring running time and memory requirements depends highly on the **machine**, and not so much on the **problem**.

Resort

Measure time and space only asymptotically using Big-O-Notation:

Time and Space

Difficulty

Measuring running time and memory requirements depends highly on the **machine**, and not so much on the **problem**.

Resort

Measure time and space only asymptotically using Big-O-Notation:

 $f(n) = O(g(n)) \iff f(n)$ "asymptotically bounded by" g(n)

Time and Space

Difficulty

Measuring running time and memory requirements depends highly on the **machine**, and not so much on the **problem**.

Resort

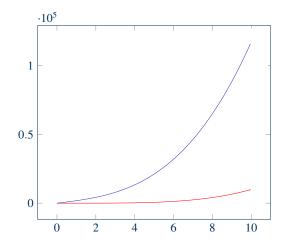

Measure time and space only asymptotically using Big-O-Notation:

 $f(n) = O(g(n)) \iff f(n)$ "asymptotically bounded by" g(n)

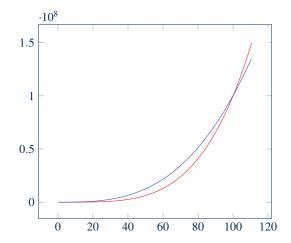

More formally:

 $f(n) = O(g(n)) \iff \exists c > 0 \exists n_0 \in \mathbb{N} \, \forall n > n_0 \colon f(n) \le c \cdot g(n).$

Complexity Theory

Approach

The **time (space) complexity** of a problem is the asymptotic running time of a fastest (least memory consumptive) algorithm that solves the problem.

Approach

The **time (space) complexity** of a problem is the asymptotic running time of a fastest (least memory consumptive) algorithm that solves the problem.

Problem

Still too difficult ...

Approach

The **time (space) complexity** of a problem is the asymptotic running time of a fastest (least memory consumptive) algorithm that solves the problem.

Problem

Still too difficult ...

Example 1.6 (Travelling Salesman Problem): Given a weighted graph, find the shortest simple path visiting every node.

Approach

The **time (space) complexity** of a problem is the asymptotic running time of a fastest (least memory consumptive) algorithm that solves the problem.

Problem

Still too difficult ...

Example 1.6 (Travelling Salesman Problem): Given a weighted graph, find the shortest simple path visiting every node.

 Best known algorithm runs in time O(n²2ⁿ) (Bellman-Held-Karp algorithm)

Approach

The **time (space) complexity** of a problem is the asymptotic running time of a fastest (least memory consumptive) algorithm that solves the problem.

Problem

Still too difficult ...

Example 1.6 (Travelling Salesman Problem): Given a weighted graph, find the shortest simple path visiting every node.

- Best known algorithm runs in time $O(n^2 2^n)$ (Bellman-Held-Karp algorithm)
- Best known lower bound is $O(n \log n)$

Approach

The **time (space) complexity** of a problem is the asymptotic running time of a fastest (least memory consumptive) algorithm that solves the problem.

Problem

Still too difficult ...

Example 1.6 (Travelling Salesman Problem): Given a weighted graph, find the shortest simple path visiting every node.

- Best known algorithm runs in time O(n²2ⁿ) (Bellman-Held-Karp algorithm)
- Best known lower bound is $O(n \log n)$
- Exact complexity of TSP unknown

Approach

Approach

Divide decision problems into the "quality" of their fastest algorithms:

• P is the class of problems solvable in polynomial time

Approach

- P is the class of problems solvable in polynomial time
- PSpace is the class of problems solvable in polynomial space

Approach

- P is the class of problems solvable in polynomial time
- PSpace is the class of problems solvable in polynomial space
- ExpTime is the class of problems solvable in exponential time

Approach

- P is the class of problems solvable in polynomial time
- PSpace is the class of problems solvable in polynomial space
- ExpTime is the class of problems solvable in exponential time
- L is the class of problems **solvable in logarithmic space** (apart from the input)

Approach

- P is the class of problems solvable in polynomial time
- PSpace is the class of problems solvable in polynomial space
- ExpTime is the class of problems solvable in exponential time
- L is the class of problems **solvable in logarithmic space** (apart from the input)
- NP is the class of problems verifiable in polynomial time

Approach

- P is the class of problems solvable in polynomial time
- PSpace is the class of problems solvable in polynomial space
- ExpTime is the class of problems solvable in exponential time
- L is the class of problems **solvable in logarithmic space** (apart from the input)
- NP is the class of problems verifiable in polynomial time
- NL is the class of problems verifiable in logarithmic space

Approach

- P is the class of problems solvable in polynomial time
- PSpace is the class of problems solvable in polynomial space
- ExpTime is the class of problems solvable in exponential time
- L is the class of problems **solvable in logarithmic space** (apart from the input)
- NP is the class of problems verifiable in polynomial time
- NL is the class of problems **verifiable in logarithmic space** And many more!

Approach

Divide decision problems into the "quality" of their fastest algorithms:

- P is the class of problems solvable in polynomial time
- PSpace is the class of problems solvable in polynomial space
- ExpTime is the class of problems solvable in exponential time
- L is the class of problems **solvable in logarithmic space** (apart from the input)
- NP is the class of problems verifiable in polynomial time
- NL is the class of problems verifiable in logarithmic space

And many more!

 \oplus P, #P, AC, AC⁰, ACC0, AM, AP, APSpace, BPL, BPP, BQP, coNP, E, FP, IP, MA, MIP, NC, NExpTime, P/poly, PH, PP, RL, RP, Σ_i^p , TISP(T(n), S(n)), ZPP, ...

Strike at What is Weak

Approach (cf. Cobham–Edmonds Thesis) The problems in P are "tractable" or "efficiently solvable" (and those outside are not)

Strike at What is Weak

Approach (cf. Cobham–Edmonds Thesis)

The problems in P are "tractable" or "efficiently solvable" (and those outside are not)

Example 1.7: The following problems are in P:

- Shortest Path Problem
- Satisfiability of Horn-Formulas
- Linear Programming
- Primality

Strike at What is Weak

Approach (cf. Cobham–Edmonds Thesis)

The problems in P are "tractable" or "efficiently solvable" (and those outside are not)

Example 1.7: The following problems are in P:

- Shortest Path Problem
- Satisfiability of Horn-Formulas
- Linear Programming
- Primality

Note

The Cobham-Edmonds-Thesis is only a **rule of thumb**: there are (practically) tractable problems outside of P, and (practically) intractable problems in P.

Caveat

It is not known how big P is. In particular, it is unknown whether $P \neq NP$ or not.

Caveat

It is not known how big P is. In particular, it is unknown whether $P \neq NP$ or not.

Approach

Try to find out which problems in a class are at least as hard as others.

Caveat

It is not known how big P is. In particular, it is unknown whether $P \neq NP$ or not.

Approach

Try to find out which problems in a class are at least as hard as others. **Complete** problems are then the hardest problems of a class.

Caveat

It is not known how big P is. In particular, it is unknown whether $P \neq NP$ or not.

Approach

Try to find out which problems in a class are at least as hard as others. **Complete** problems are then the hardest problems of a class.

Example 1.8: Satisfiability of propositional formulas is **NP-complete**: if we can efficiently decide whether a propositional formula is satisfiable, we can solve **any** problem in NP efficiently.

Caveat

It is not known how big P is. In particular, it is unknown whether $P \neq NP$ or not.

Approach

Try to find out which problems in a class are at least as hard as others. **Complete** problems are then the hardest problems of a class.

Example 1.8: Satisfiability of propositional formulas is **NP-complete**: if we can efficiently decide whether a propositional formula is satisfiable, we can solve **any** problem in NP efficiently.

But: we still do not know whether we can or cannot solve satisfiability efficiently. We only know it will be difficult to find out ...

Learning Goals

- Get an overview over the foundations of Complexity Theory
- Gain insights into advanced techniques and results in Complexity Theory
- Understand what it means to "compute" something, and what the strengths and limits of different computing approaches are
- Get a feeling of how hard certain problems are, and where this hardness comes from
- Appreciate how very little we actually know about the computational complexity of many problems

Lecture Outline (1)

• Turing Machines (Revision)

Definition of Turing Machines; Variants; Computational Equivalence; Decidability and Recognizability; Enumeration; Oracles

• Undecidability

Examples of Undecidable Problems; Mapping Reductions; Rice's Theorem; Recursion Theorem

• Time Complexity

Measuring Time Complexity; Many-One Reductions; Cook-Levin Theorem; Time Complexity Classes (P, NP, ExpTime); NP-completeness; pseudo-NP-complete problems

• Space Complexity

Space Complexity Classes (PSpace, L, NL); Savitch's Theorem; PSpace-completeness; NL-completeness; NL = coNL

Lecture Outline (2)

• Diagonalisation

Hierarchy Theorems (det. Time, non-det. Time, Space); Gap Theorem; Ladner's Theorem; Relativisation; Baker-Gill-Solovay Theorem

• Alternation

Alternating Turing Machines; APTime = PSpace; APSpace = ExpTime; Polynomial Hierarchy

• Circuit Complexity

Boolean Circuits; Alternative Proof of Cook-Levin Theorem; Parallel Computation (NC); P-completeness; P/poly; (Karp-Lipton Theorem, Meyer's Theorem)

• Probabilistic Computation

Randomised Complexity Classes (RP, PP, BPP, ZPP); Sipser-Gács-Lautemann Theorem

• Quantum Computing

Quantum mechanics for computer scientists, entanglement, quantum circuits, BQP

Avoid what is Strong, and Strike at what is Weak

Sometimes the best way to solve a problem is to avoid it ...
